

Chapter 9

Network Management

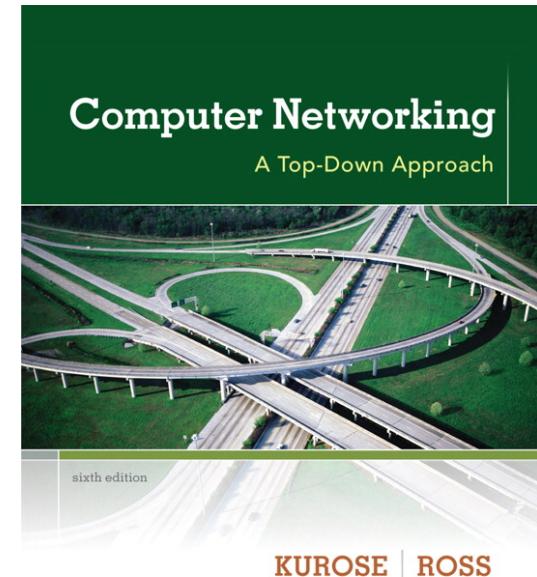

A note on the use of these ppt slides:

We're making these slides freely available to all (faculty, students, readers). They're in PowerPoint form so you see the animations; and can add, modify, and delete slides (including this one) and slide content to suit your needs. They obviously represent a *lot* of work on our part. In return for use, we only ask the following:

- ❖ If you use these slides (e.g., in a class) that you mention their source (after all, we'd like people to use our book!)
- ❖ If you post any slides on a www site, that you note that they are adapted from (or perhaps identical to) our slides, and note our copyright of this material.

Thanks and enjoy! JFK/KWR

Chapter 9: Network Management

Chapter goals:

- ❖ introduction to network management
 - motivation
 - major components
- ❖ Internet network management framework
 - MIB: management information base
 - SMI: data definition language
 - SNMP: protocol for network management
 - security and administration
- ❖ presentation services: ASN.1

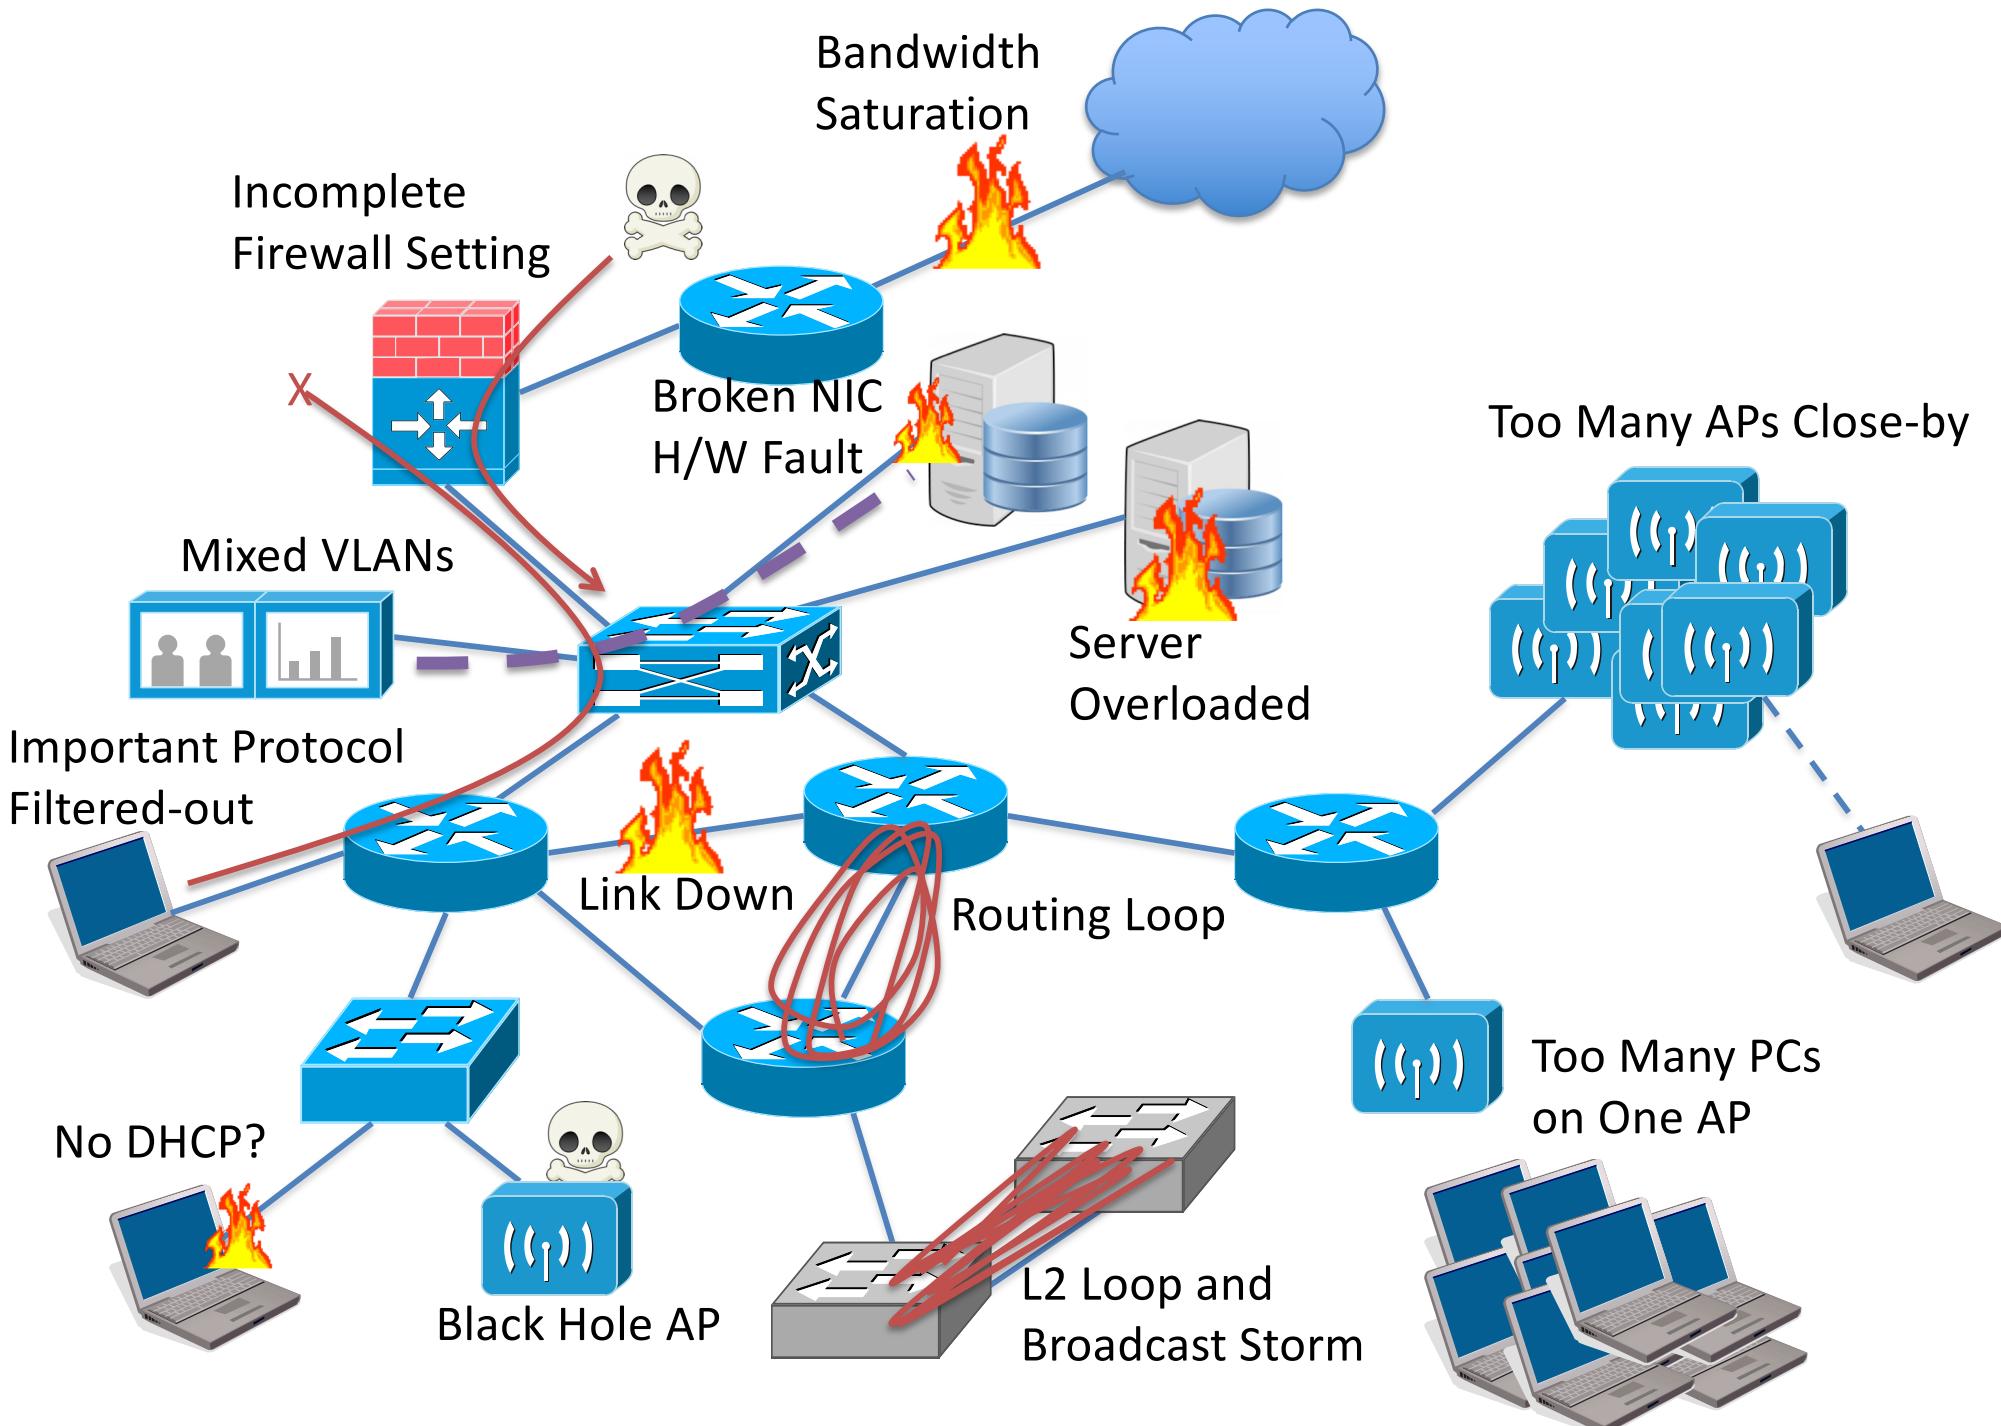

What's UP?

- Can't access Facebook
- Can't access IITH web site
- Can't receive an e-mail
- Can't join VC session
- Remote login to lab server fails
- Paper download from IEEE fails
- ...
- ...
- Can't share a file with PC in next room
- ...
- Anyway, network is sooooooooo slow
- Looks trouble, but no idea what's happening and who is on troubleshooting

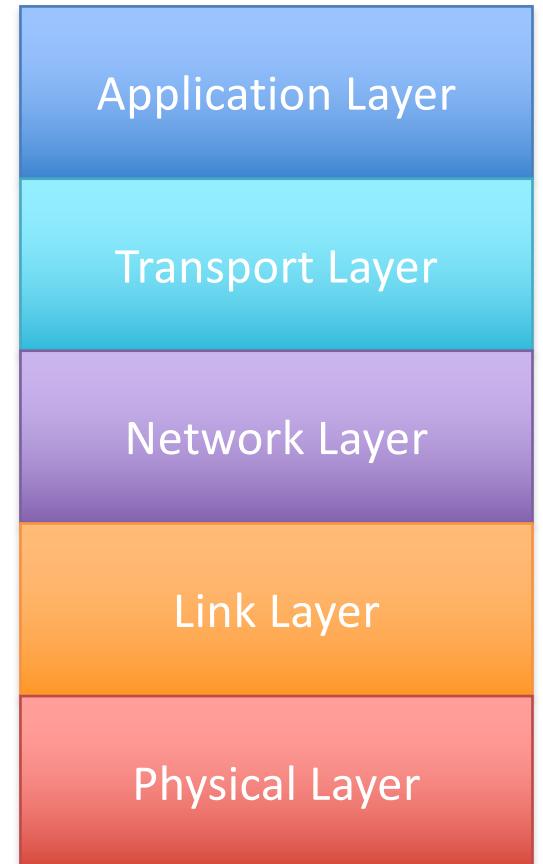

Network gets disrupted

- Why?
 - Networking software has bugs
 - Networking hardware has its life time
 - People make mistakes
 - Systems have upper limit of performance
 - Bandwidth is limited and not free of charge
 - Network is always exposed to attackers and malwares
 - Natural disaster happens
 - Infrastructures are not perfect

Trouble?

- What is Happening?
- Where the trouble happens?
- Why and how does it happens?
- Since when did it happen?
- Can't access to Google
 - Is your proxy setting correct?
 - Is TCP connection to proxy established?
 - Can your PC reach proxy?
 - Can proxy reach Facebook?
 - Does your PC have an appropriate IP address?
 - Are your PC really connected to LAN?

Long Way Before Troubleshooting

- Plan service and population
- Estimate required resource with appropriate capacity margin
- Design and implement networks
- Monitor service and network
- Know the normal situation
- Distinguish anomalies
(Here we know a trouble!!)

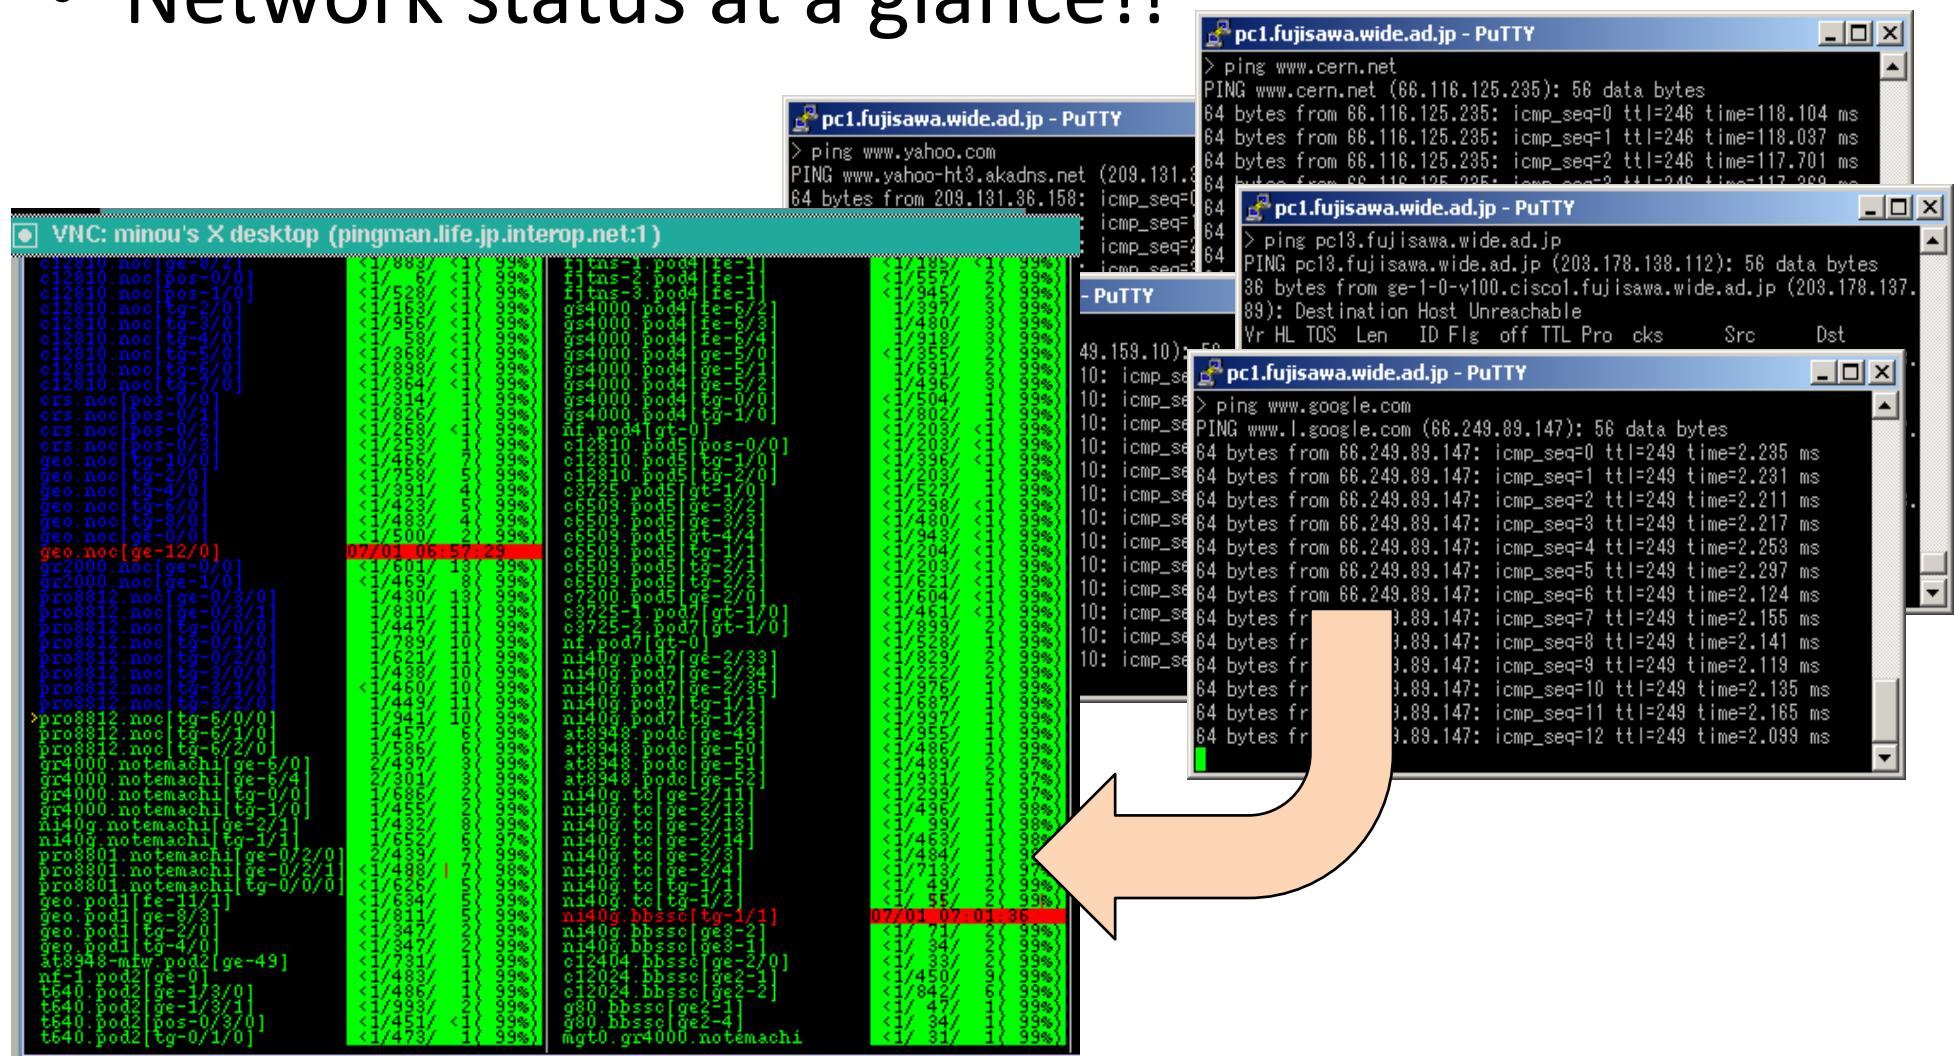

Very Basic Troubleshooting Tools

- ping
 - Does packet reach the destination and come back?
 - How long is RTT (Round-trip Time)?
- traceroute
 - Which path does packet go towards the destination?
 - Where it takes long time to pass through in the?
 - Helps to detect routing loop

Why is Visualizing Data Important?

- Network status at a glance!!

Multi-point Monitoring

- Rough Monitoring (wide and many)

- Reachability
- Delay
- Jitter

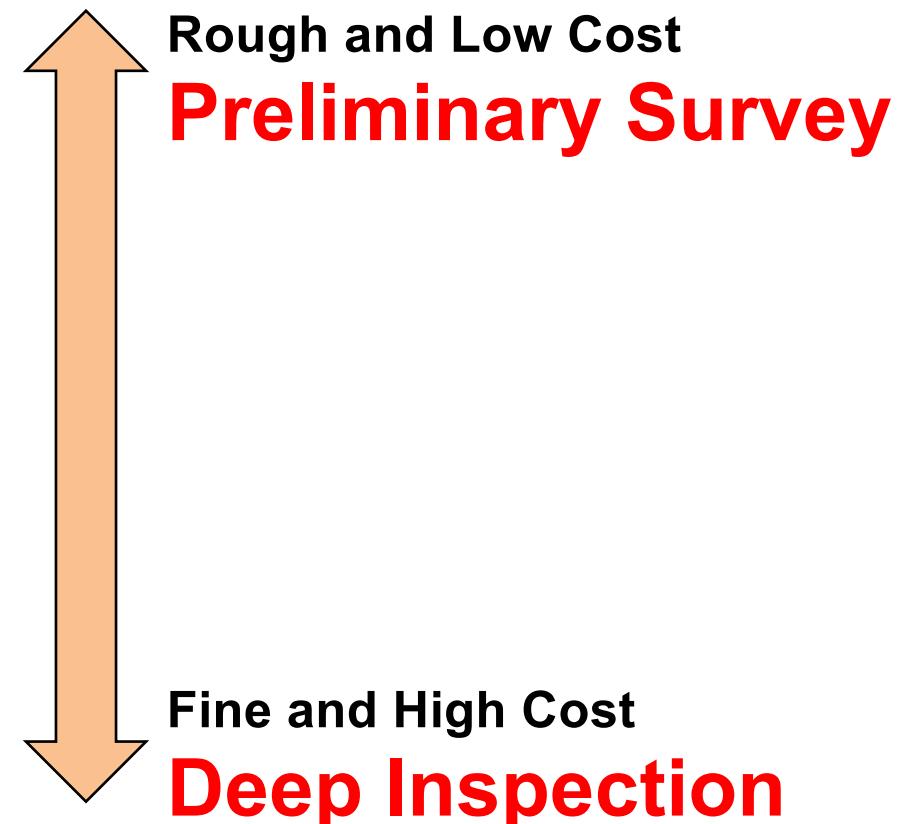

- Then we go for more details

Pingman

Granularity of Information

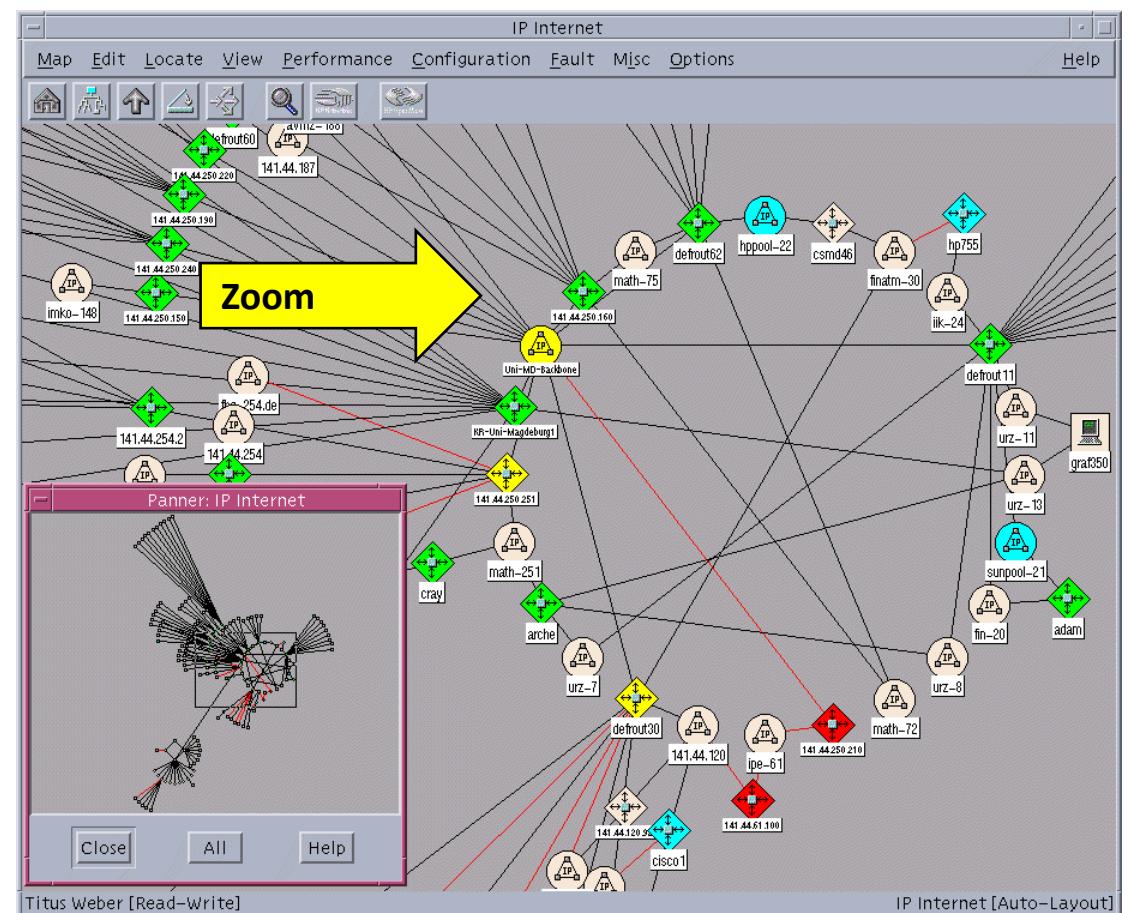

- Is service available?
- Is reachable?
- Is routing correct?
- Is topology correct?
- Is quality fine?
 - RTT, Jitter, Packet Loss
 - Throughput
- Is the contents of packet normal?

Understanding Network topology

- Overview to Detail
 - Not reachable?
 - From where?
 - Beyond where?
- Scale of Impact?
- Why and where it happened?
- Identify problematic nodes

Spec, Limitation and Planning

- If you procure a backbone router, what kind of information should we carefully check?
- Packet processing performance
- Backplane capacity
- Power consumption
- Heat emission
- Dimension and weight

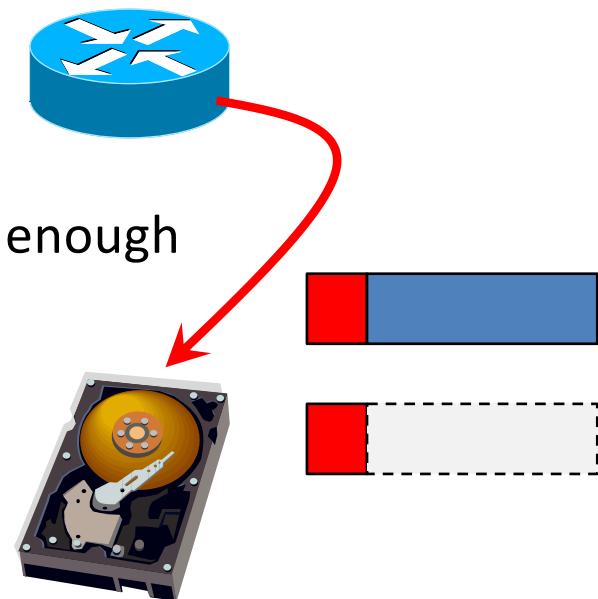

Monitoring Uses Resources

- What is the cost of monitoring?
 - Additional CPU load to equipment
 - Network bandwidth to transmit monitoring data
 - Disk space to store data
 - Additional HW and SW for monitoring purpose

Defining “What we want to know”

- Total volume of traffic
 - Traffic counter on I/F serves very well
- Trend of network flow
 - Sampling (1 packet out of 100, for example) is enough
 - Depends on the traffic volume
- Distribution of protocols
 - First 128 of entire packet is enough
- We can know a lot of things without storing huge packet capture data, at the same time
- We need packet capture for some purposes
 - R&D, Security, Troubleshooting, etc...

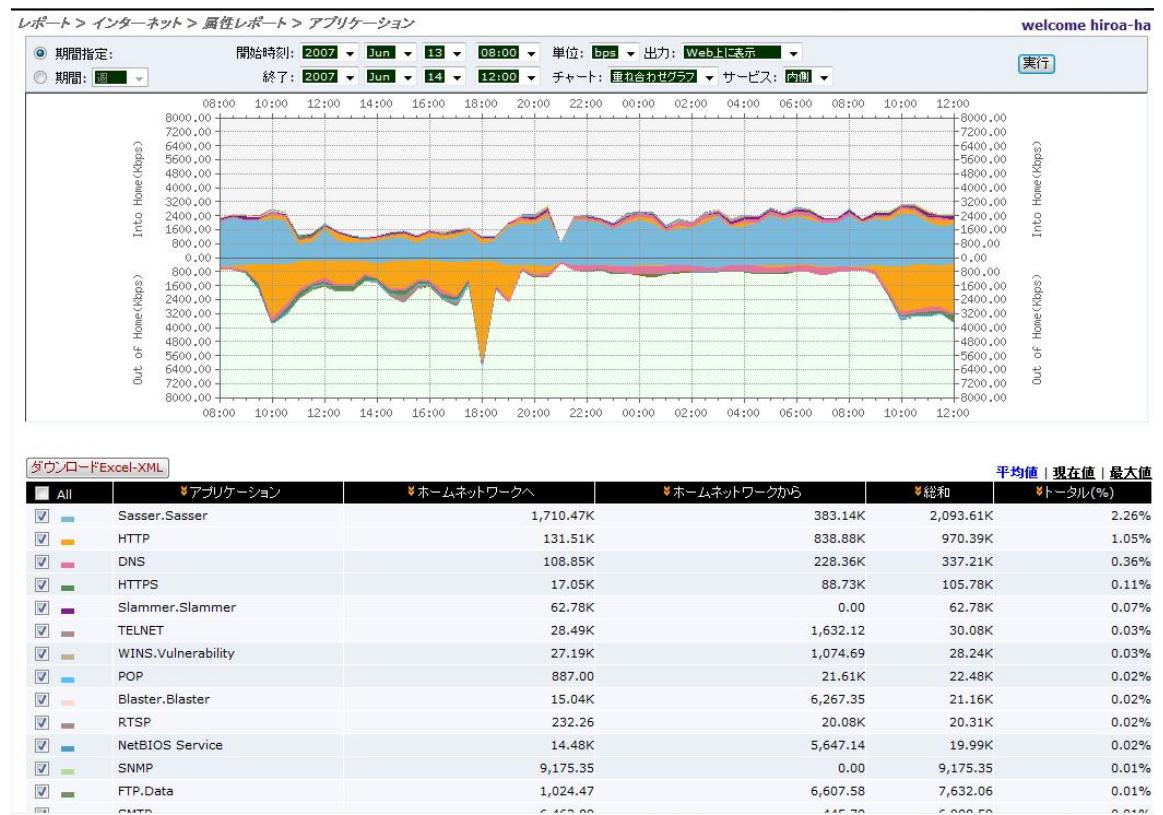

Some Questions

- Which data are we going to keep?
- How fast does its size grow?
- How long do we keep that data?
- Need to watch carefully
 - Tcpdump data, Squid log, HTTP access log,

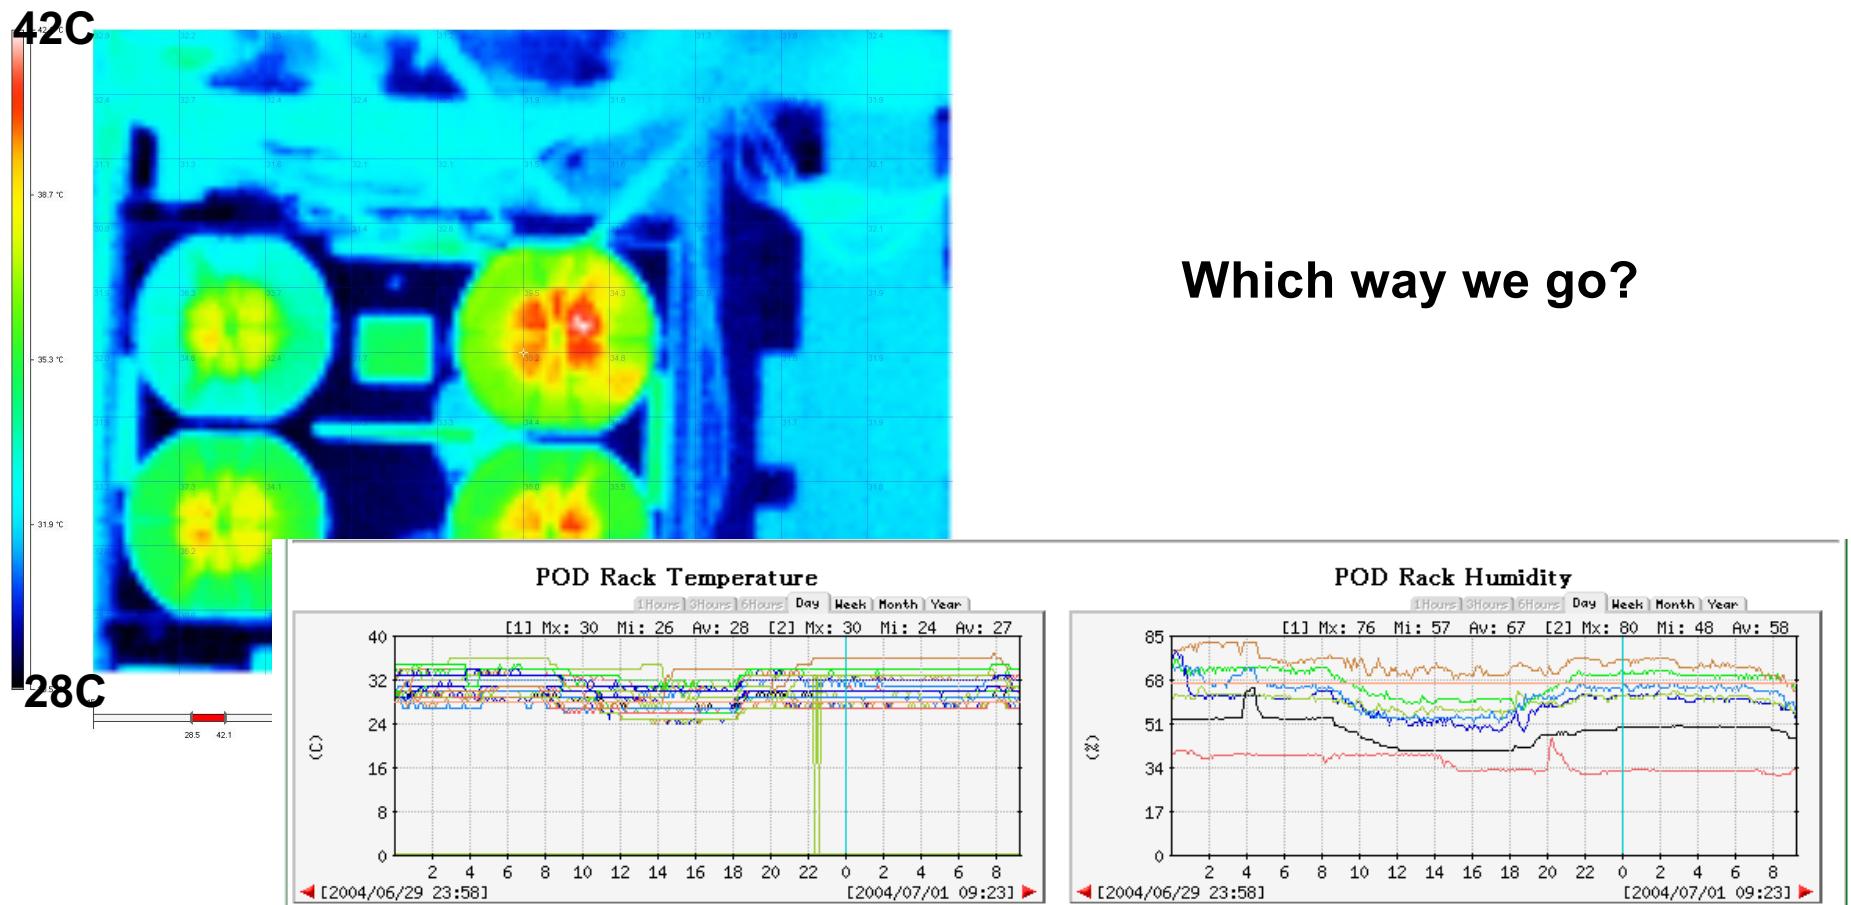

Flow-based Monitoring

- Sampling
 - Statistically analyze the traffic trend
 - Capture 1 out of N packets, only headers
 - sFlow/NetFlow

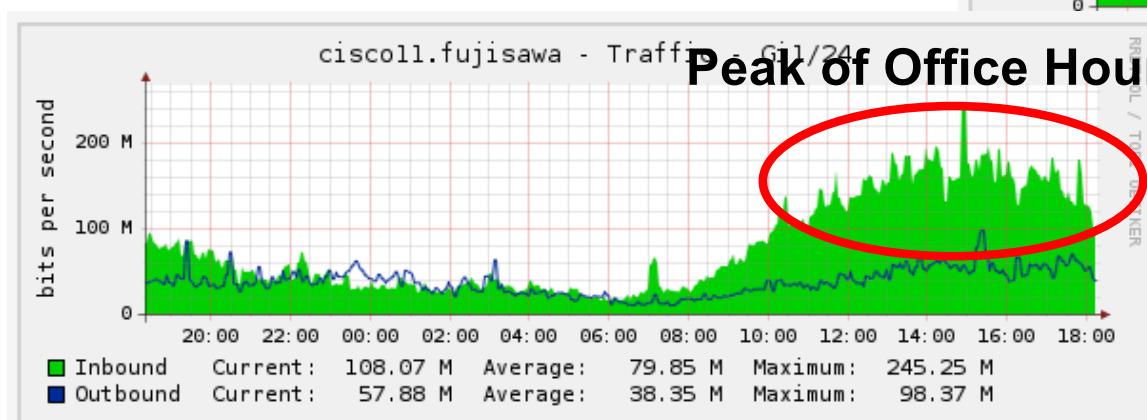

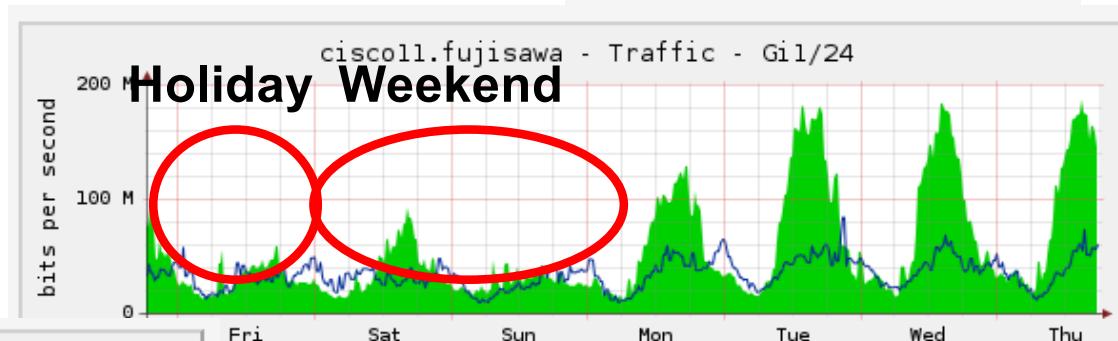

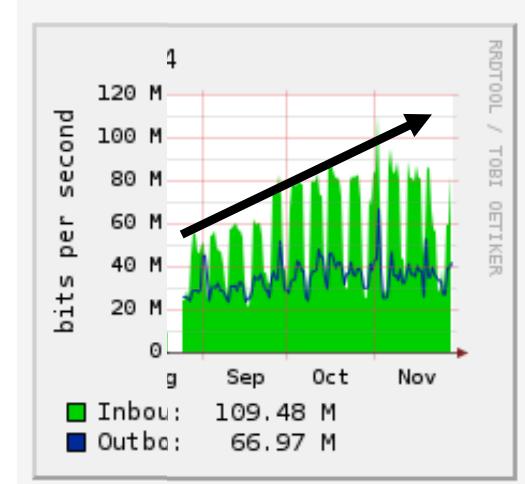

Temperature and Humidity

- Check CPU temperature using SNMP
- Put thermometer on top of rack
- Monitor with infra-red sensors

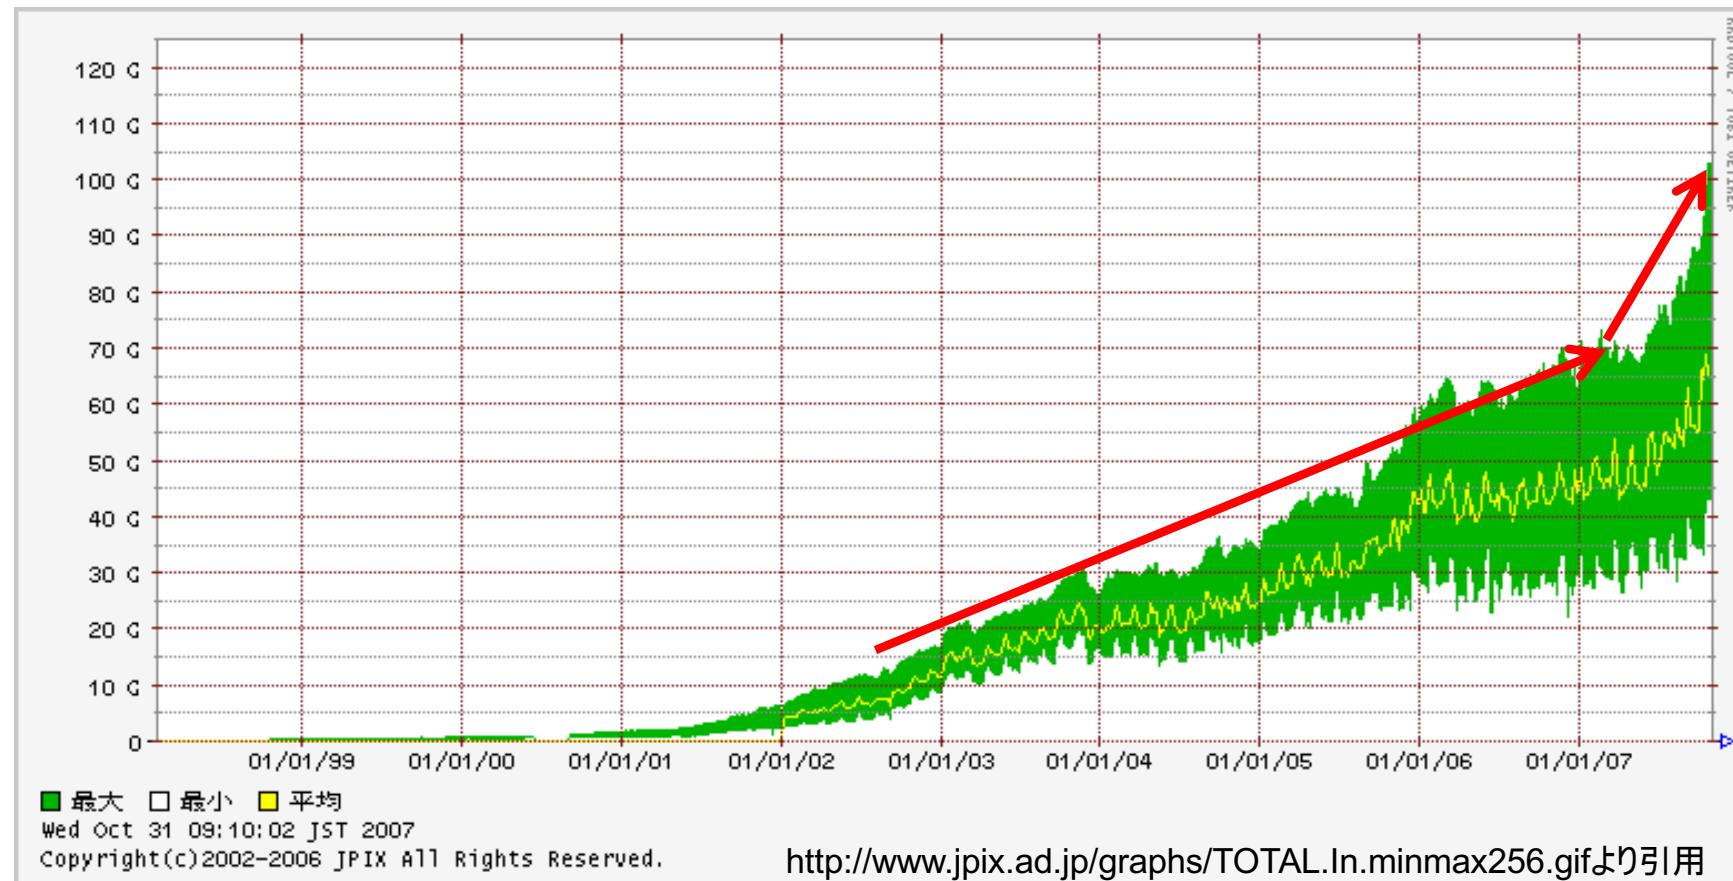

Knowing Peaks, Trends and Estimating Future from Data

- Daily Observation
 - When is the network busiest?
- Weekly Observation
 - On what kind of day is vacant and busy
- Long-term Observation
 - Is the network demand increasing?
 - How much?

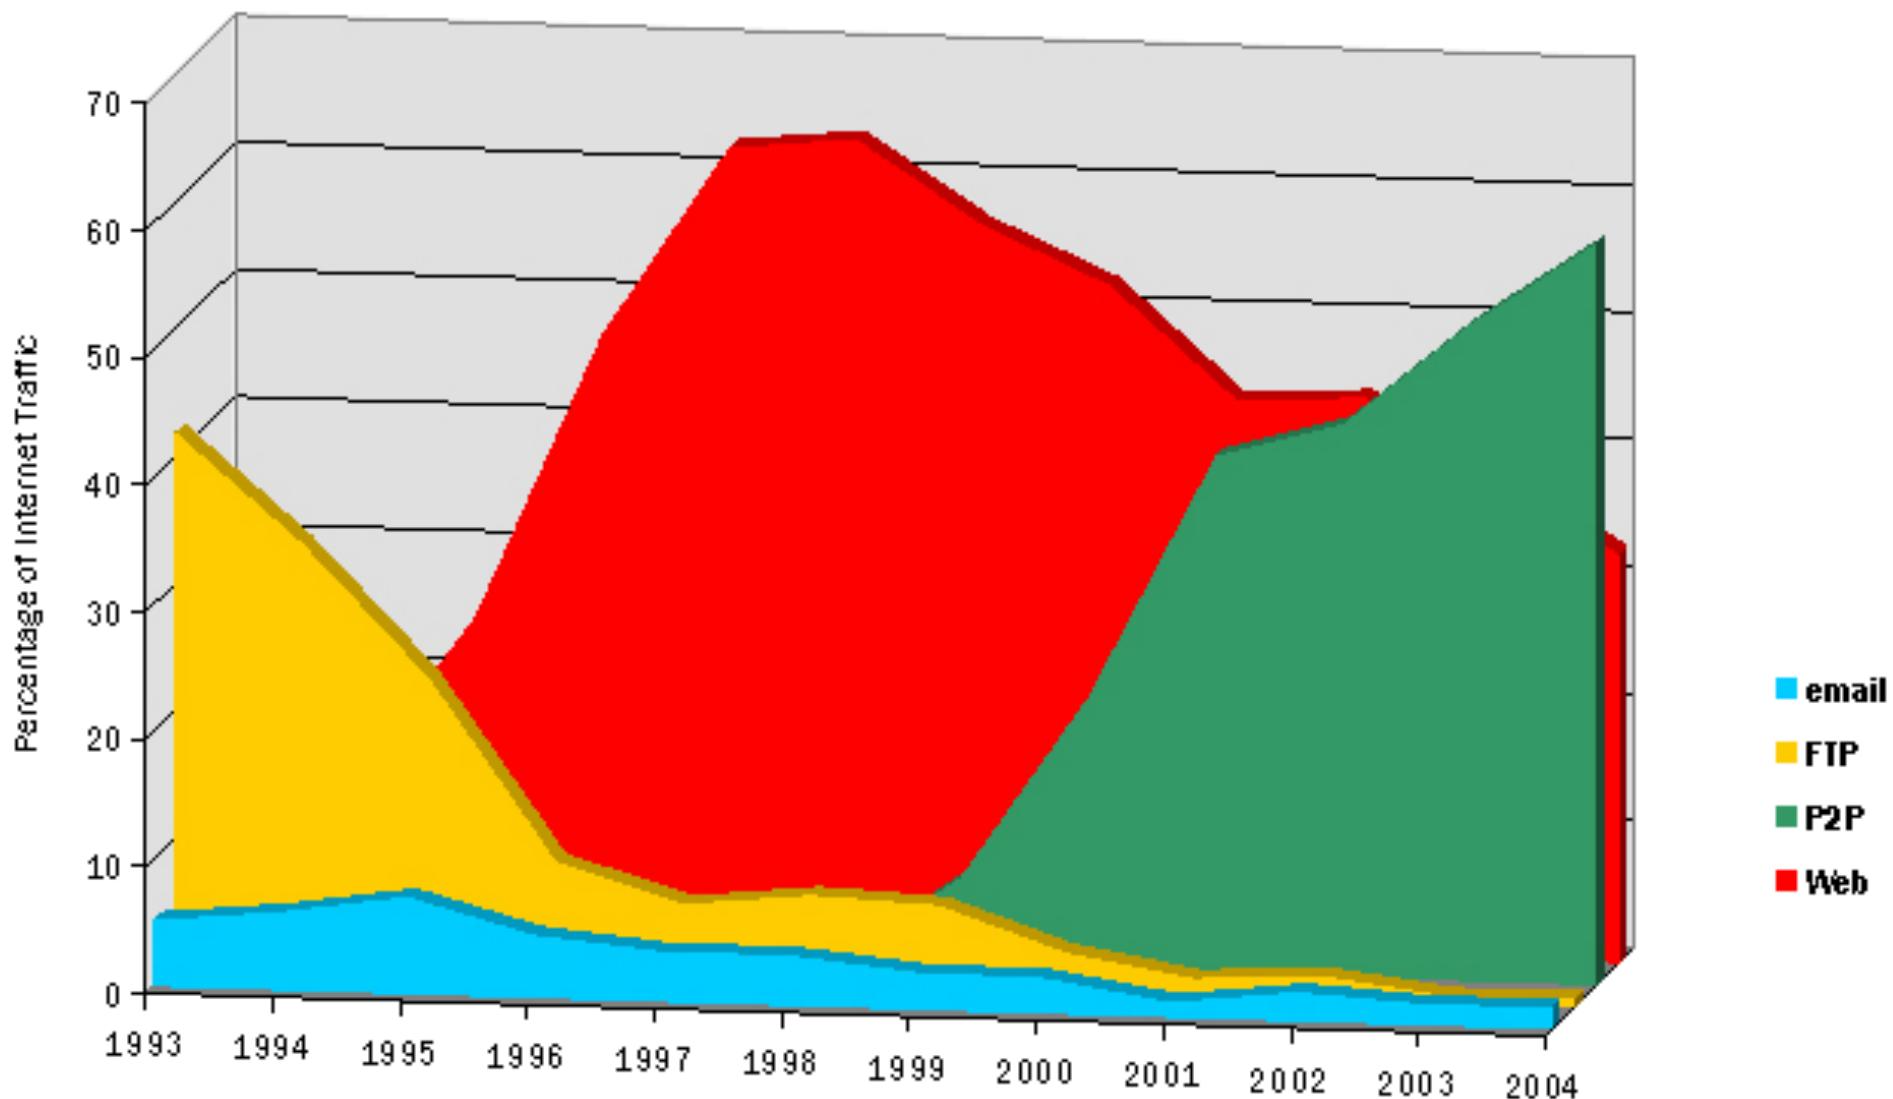

Traffic Growth in IX

- IX: Internet Exchange = Core of the Internet
- Application Breakthrough, Infrastructure breakthrough

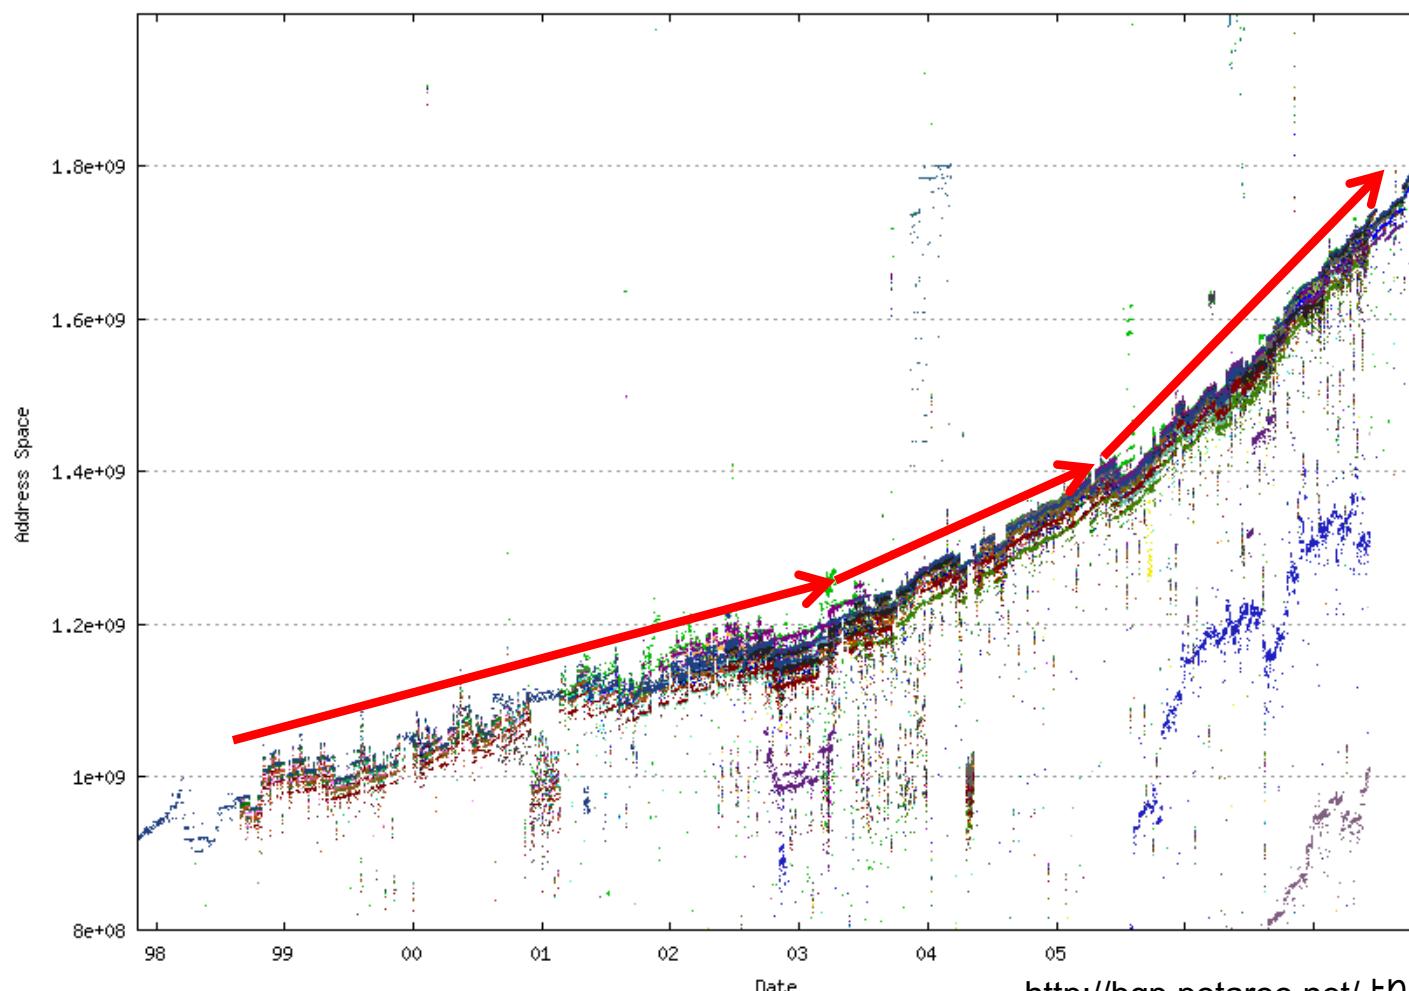

Change of Application Trends

CacheLogic Research | Internet Protocols Trends - 1993 to 2004

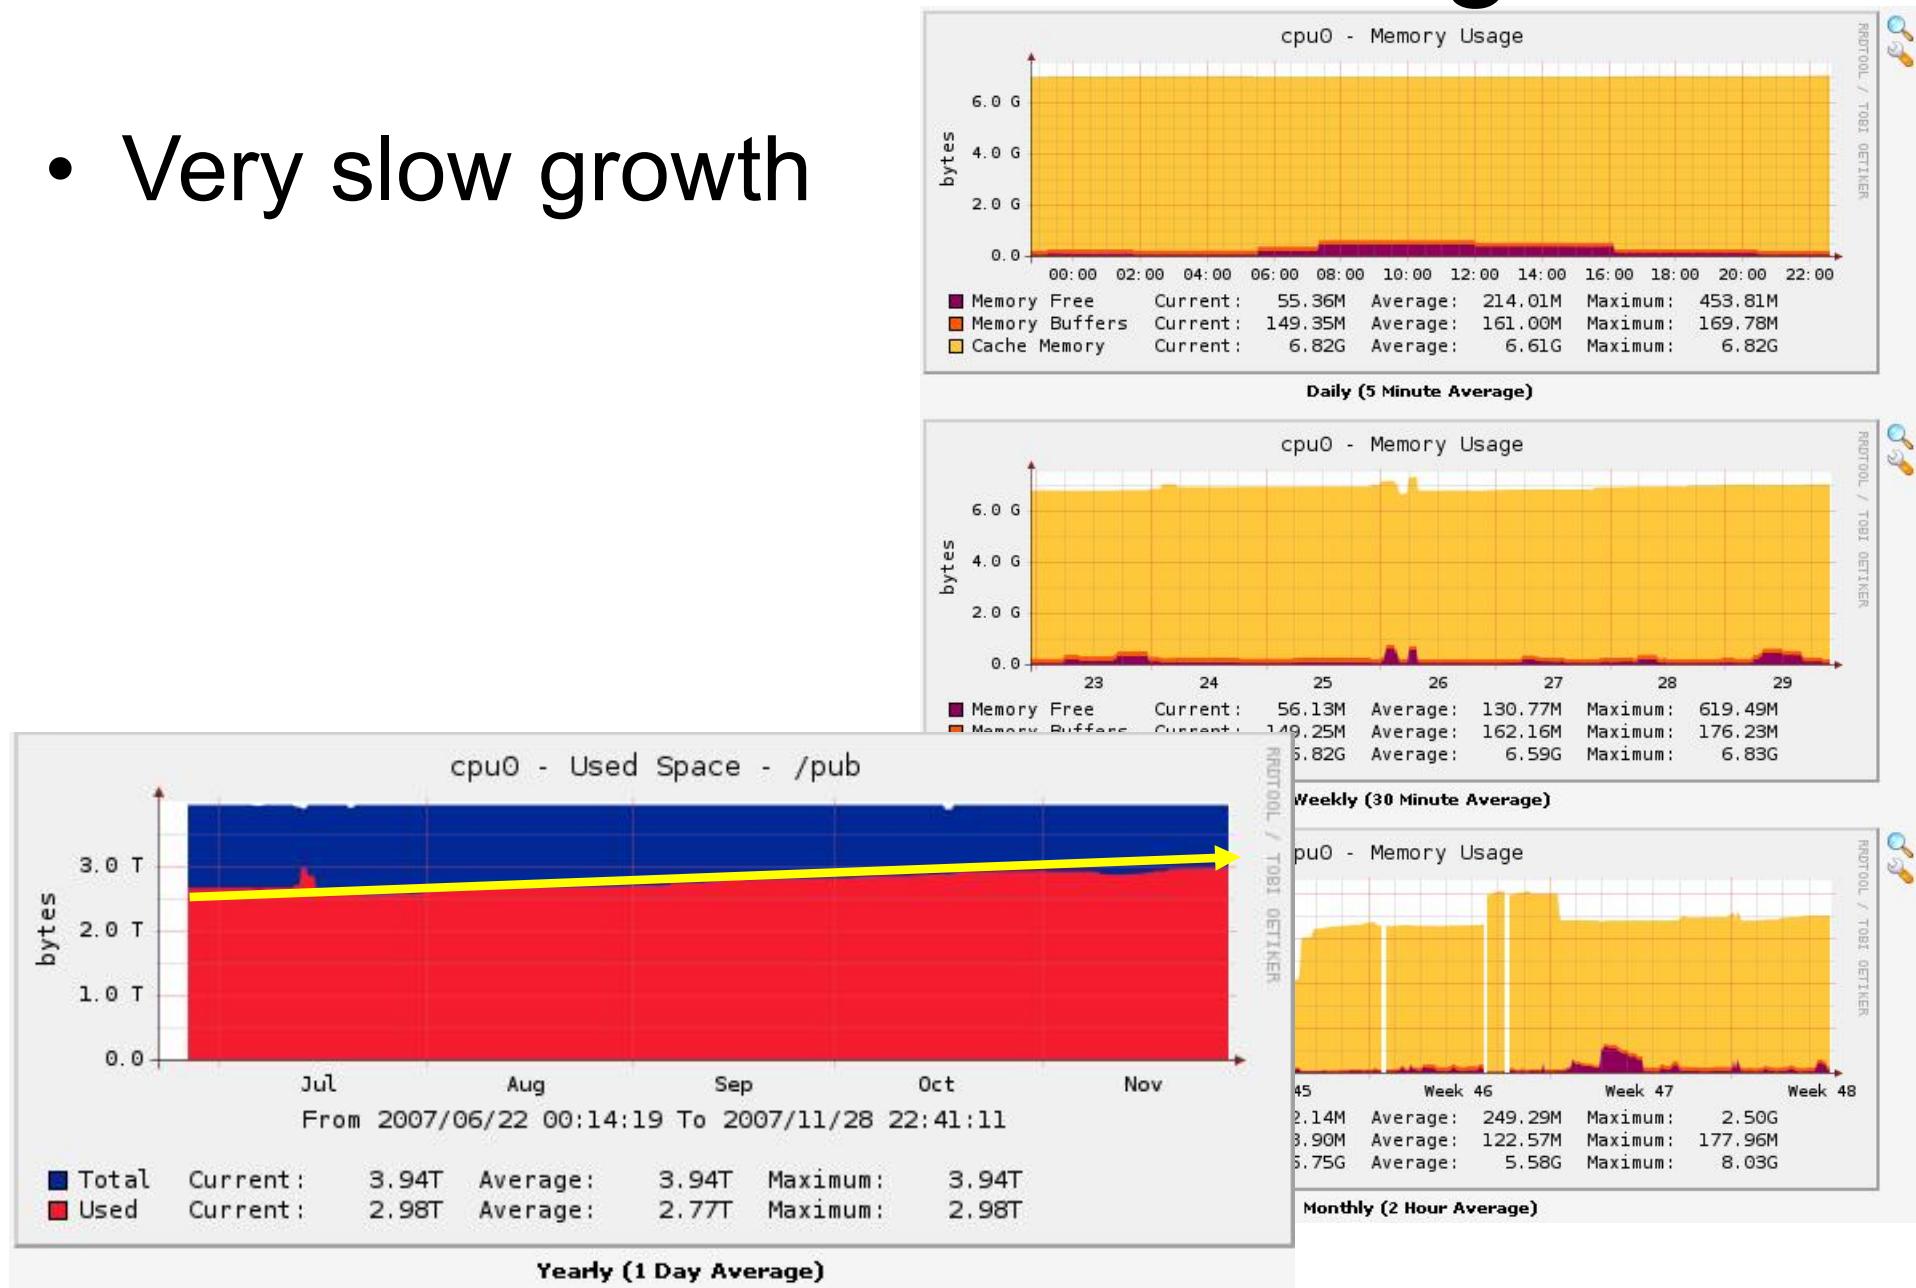

Number of BGP Full Route

- Is the memory of routers enough?

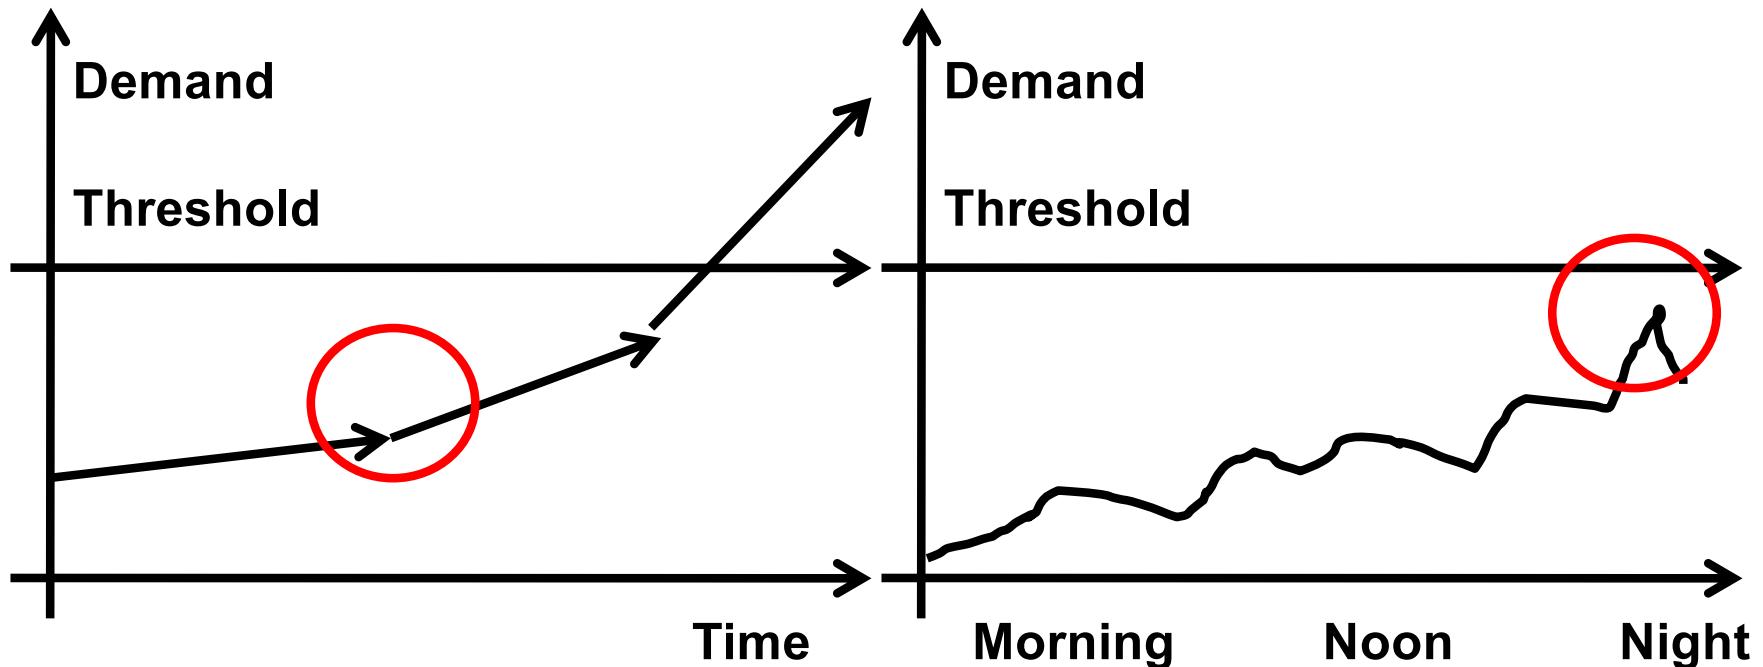

Is demand increasing?

- Very slow growth

How to estimate demand increase?

- Increasing demand glows even more rapidly
- Stay aware of demand increase
- Do consider the peak demand

Intermediate Summary

- Monitoring Services and Networks
 - “broader overview” and “deep inspection”
 - “Just reach” or “Appropriately reach”
 - Importance of visualization
 - Tradeoffs between monitoring granularity and cost
- Make feedback from statistic evidence to the operation in next stage
 - What kind of difficulty will we face in the future??
 - When does it happens?
 - Let’s be prepared with some solutions before it happens!!

Chapter 9 outline

- ❖ What is network management?
- ❖ Internet-standard management framework
 - Structure of Management Information: SMI
 - Management Information Base: MIB
 - SNMP Protocol Operations and Transport Mappings
 - Security and Administration
- ❖ ASN.1

What is network management?

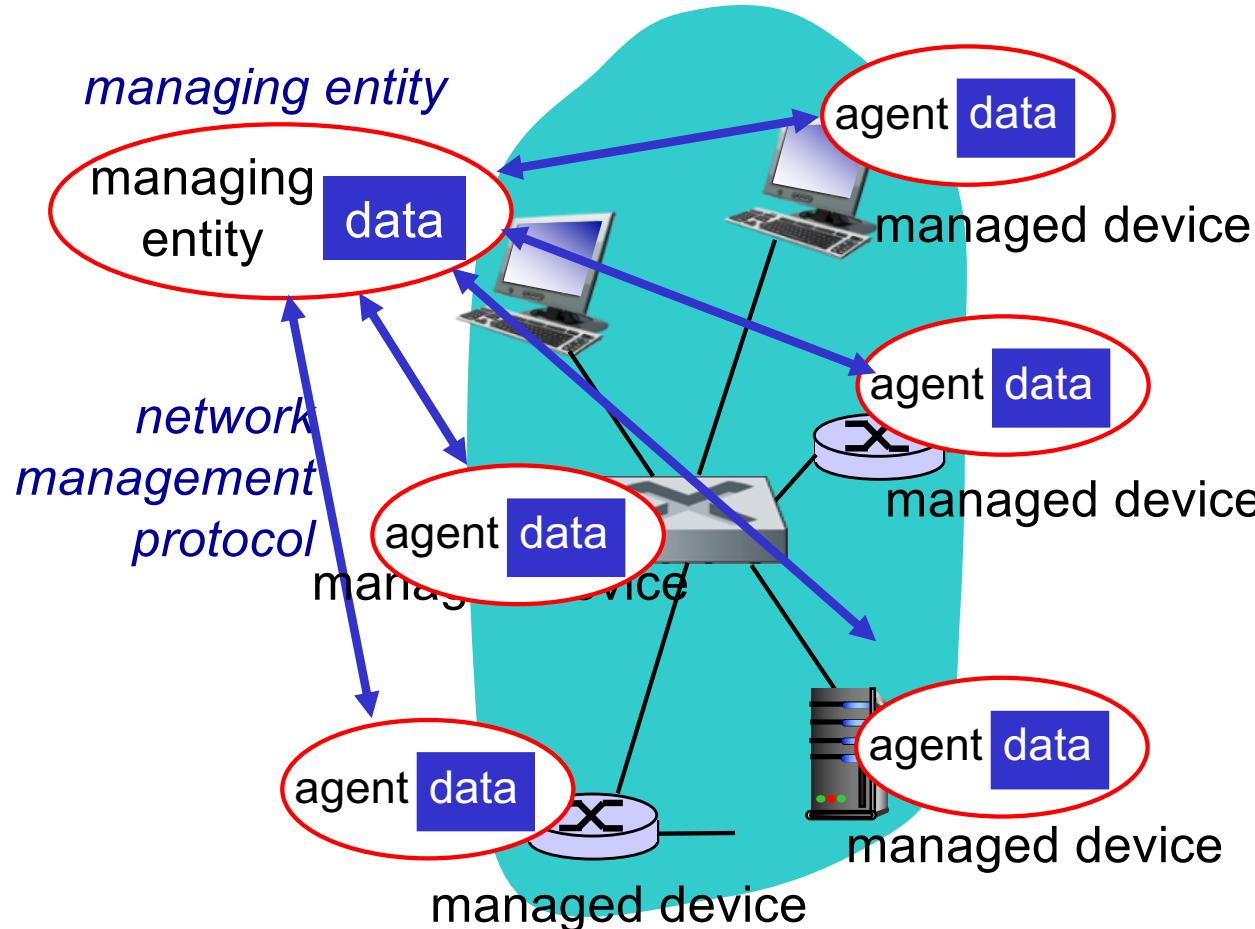

- ❖ **autonomous systems** (aka “network”): 1000s of interacting hardware/software components
- ❖ other complex systems requiring monitoring, control:
 - jet airplane
 - nuclear power plant
 - others?

"Network management includes the deployment, integration and coordination of the hardware, software, and human elements to monitor, test, poll, configure, analyze, evaluate, and control the network and element resources to meet the real-time, operational performance, and Quality of Service requirements at a reasonable cost."

Infrastructure for network management

definitions:

managed devices contain managed objects whose data is gathered into a Management Information Base (MIB)

Network management standards

OSI CMIP

- ❖ Common Management Information Protocol
- ❖ designed 1980's: *the unifying net management standard*
- ❖ too slowly standardized

SNMP: Simple Network Management Protocol

- ❖ Internet roots (SGMP)
- ❖ started simple
- ❖ deployed, adopted rapidly
- ❖ growth: size, complexity
- ❖ currently: SNMP V3
- ❖ *de facto network management standard*

Chapter 9 outline

- ❖ What is network management?
- ❖ Internet-standard management framework
 - Structure of Management Information: SMI
 - Management Information Base: MIB
 - SNMP Protocol Operations and Transport Mappings
 - Security and Administration
- ❖ ASN.1

SNMP overview: 4 key parts

- ❖ **Management information base (MIB):**
 - distributed information store of network management data
- ❖ **Structure of Management Information (SMI):**
 - data definition language for MIB objects
- ❖ **SNMP protocol**
 - convey manager<->managed object info, commands
- ❖ **security, administration capabilities**
 - major addition in SNMPv3

SMI: data definition language

Purpose: syntax, semantics of management data well-defined, unambiguous

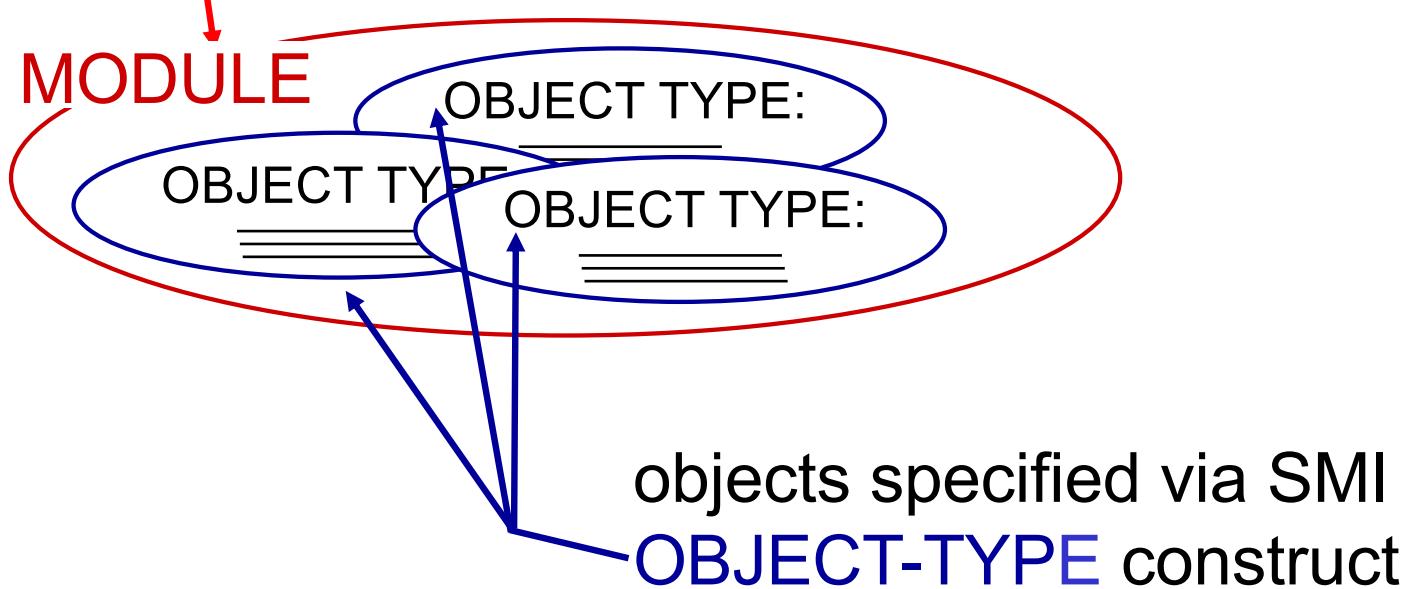

- ❖ base data types:
 - straightforward, boring
- ❖ OBJECT-TYPE
 - data type, status, semantics of managed object
- ❖ MODULE-IDENTITY
 - groups related objects into MIB module

Basic Data Types

INTEGER
Integer32
Unsigned32
OCTET STRING
OBJECT IDENTIFIED
IPaddress
Counter32
Counter64
Guage32
Time Ticks
Opaque

SNMP MIB

MIB module specified via SMI
MODULE-IDENTITY
(100 standardized MIBs, more vendor-specific)

SMI: object, module examples

OBJECT-TYPE: ipInDelivers

ipInDelivers OBJECT TYPE
SYNTAX Counter32
MAX-ACCESS read-only
STATUS current
DESCRIPTION
“The total number of input
datagrams successfully
delivered to IP user-
protocols (including ICMP)”
 ::= { ip 9}

MODULE-IDENTITY: ipMIB

ipMIB MODULE-IDENTITY
LAST-UPDATED “941101000Z”
ORGANIZATION “IETF SNPv2
Working Group”
CONTACT-INFO
“ Keith McCloghrie
”
.....
DESCRIPTION
“The MIB module for managing
IP
and ICMP implementations, but
excluding their management of
IP routes.”
REVISION “019331000Z”
.....
 ::= {mib-2 48}

MIB example: UDP module

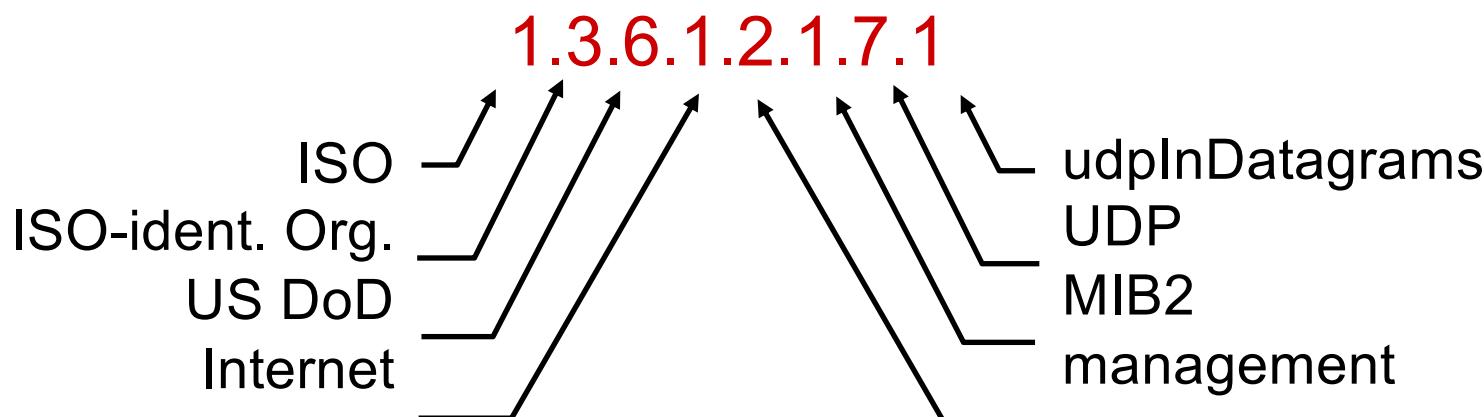

<u>Object ID</u>	<u>Name</u>	<u>Type</u>	<u>Comments</u>
1.3.6.1.2.1.7.1	UDPIInDatagrams	Counter32	total # datagrams delivered at this node
1.3.6.1.2.1.7.2	UDPNoPorts	Counter32	# undeliverable datagrams: no application at port
1.3.6.1.2.1.7.3	UDInErrors	Counter32	# undeliverable datagrams: all other reasons
1.3.6.1.2.1.7.4	UDPOutDatagrams	Counter32	# datagrams sent
1.3.6.1.2.1.7.5	udpTable	SEQUENCE	one entry for each port in use by app, gives port # and IP address

SNMP naming

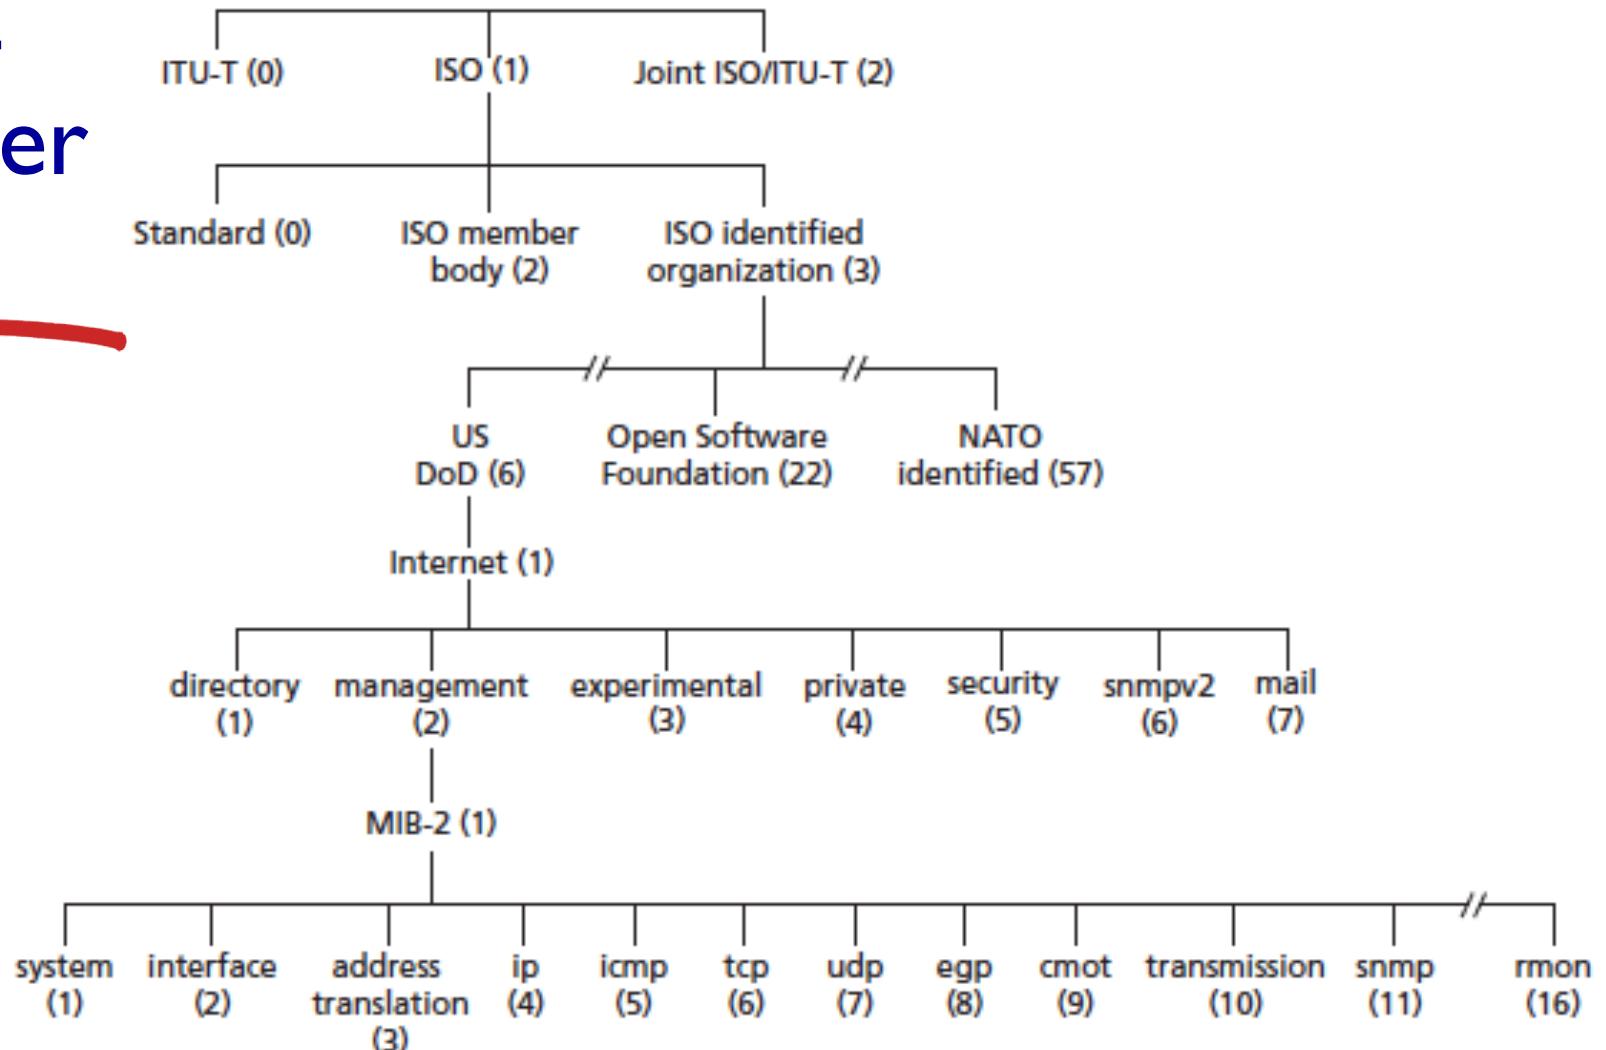

question: how to name every possible standard object
(protocol, data, more..) in every possible network
standard??

answer: ISO Object Identifier tree:

- hierarchical naming of all objects
- each branchpoint has name, number

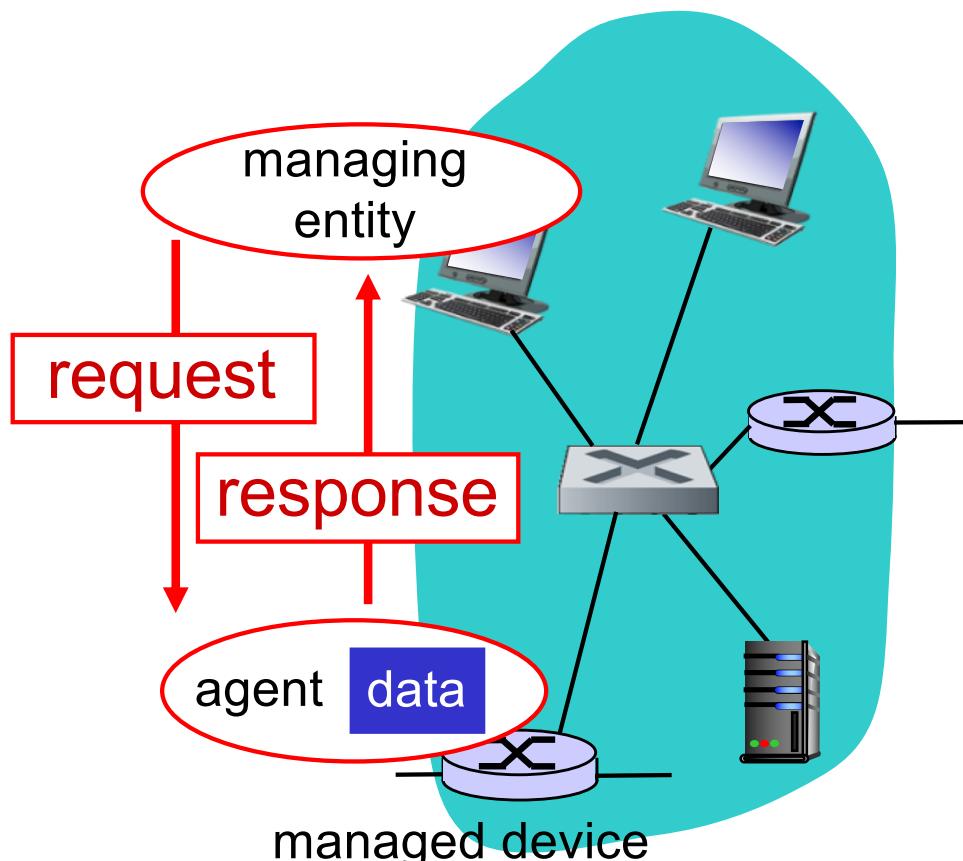

OSI Object Identifier Tree

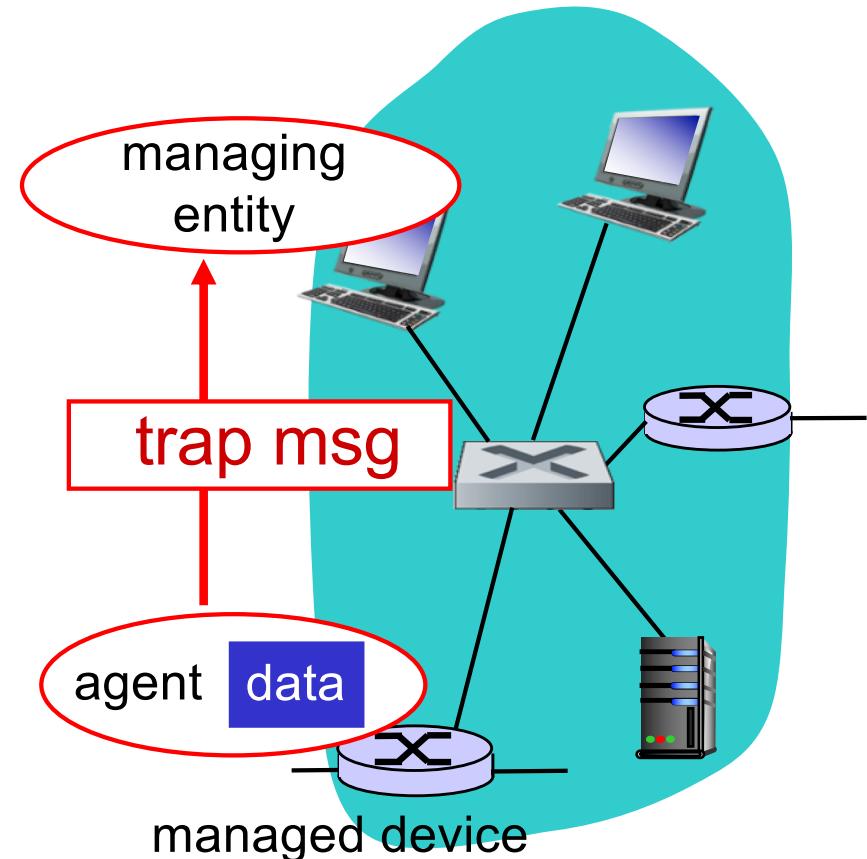

SNMP protocol

Two ways to convey MIB info, commands:

request/response mode

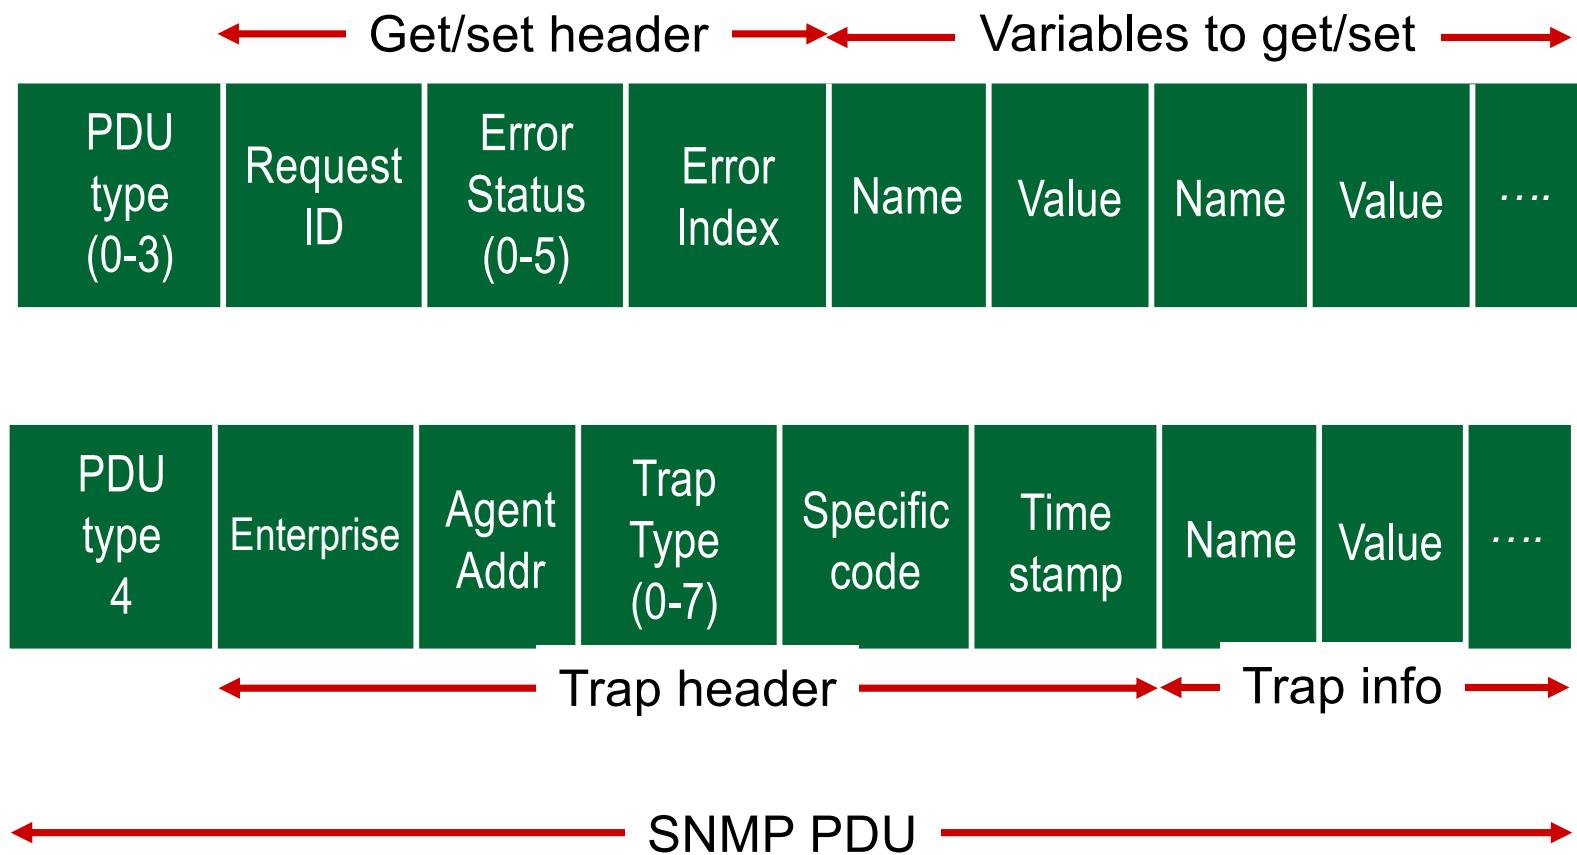

trap mode

SNMP protocol: message types

<u>Message type</u>	<u>Function</u>
GetRequest GetNextRequest GetBulkRequest	Mgr-to-agent: “get me data” (instance,next in list, block)
InformRequest	Mgr-to-Mgr: here’s MIB value
SetRequest	Mgr-to-agent: set MIB value
Response	Agent-to-mgr: value, response to Request
Trap	Agent-to-mgr: inform manager of exceptional event

SNMP protocol: message formats

SNMP security and administration

- ❖ **encryption:** DES-encrypt SNMP message
- ❖ **authentication:** compute, send $\text{MIC}(m,k)$:
compute hash (MIC) over message (m), secret shared key (k)
- ❖ **protection against playback:** use nonce
- ❖ **view-based access control:**
 - SNMP entity maintains database of access rights, policies for various users
 - database itself accessible as managed object!

Chapter 9 outline

- ❖ What is network management?
- ❖ Internet-standard management framework
 - Structure of Management Information: SMI
 - Management Information Base: MIB
 - SNMP Protocol Operations and Transport Mappings
 - Security and Administration
- ❖ The presentation problem: ASN.1

The presentation problem

Q: does perfect memory-to-memory copy solve
“the communication problem”?

A: not always!

```
struct {  
    char code;  
    int x;  
} test;  
test.x = 256;  
test.code= 'a'
```

test.code
test.x

a
00000001
00000011

host 1 format

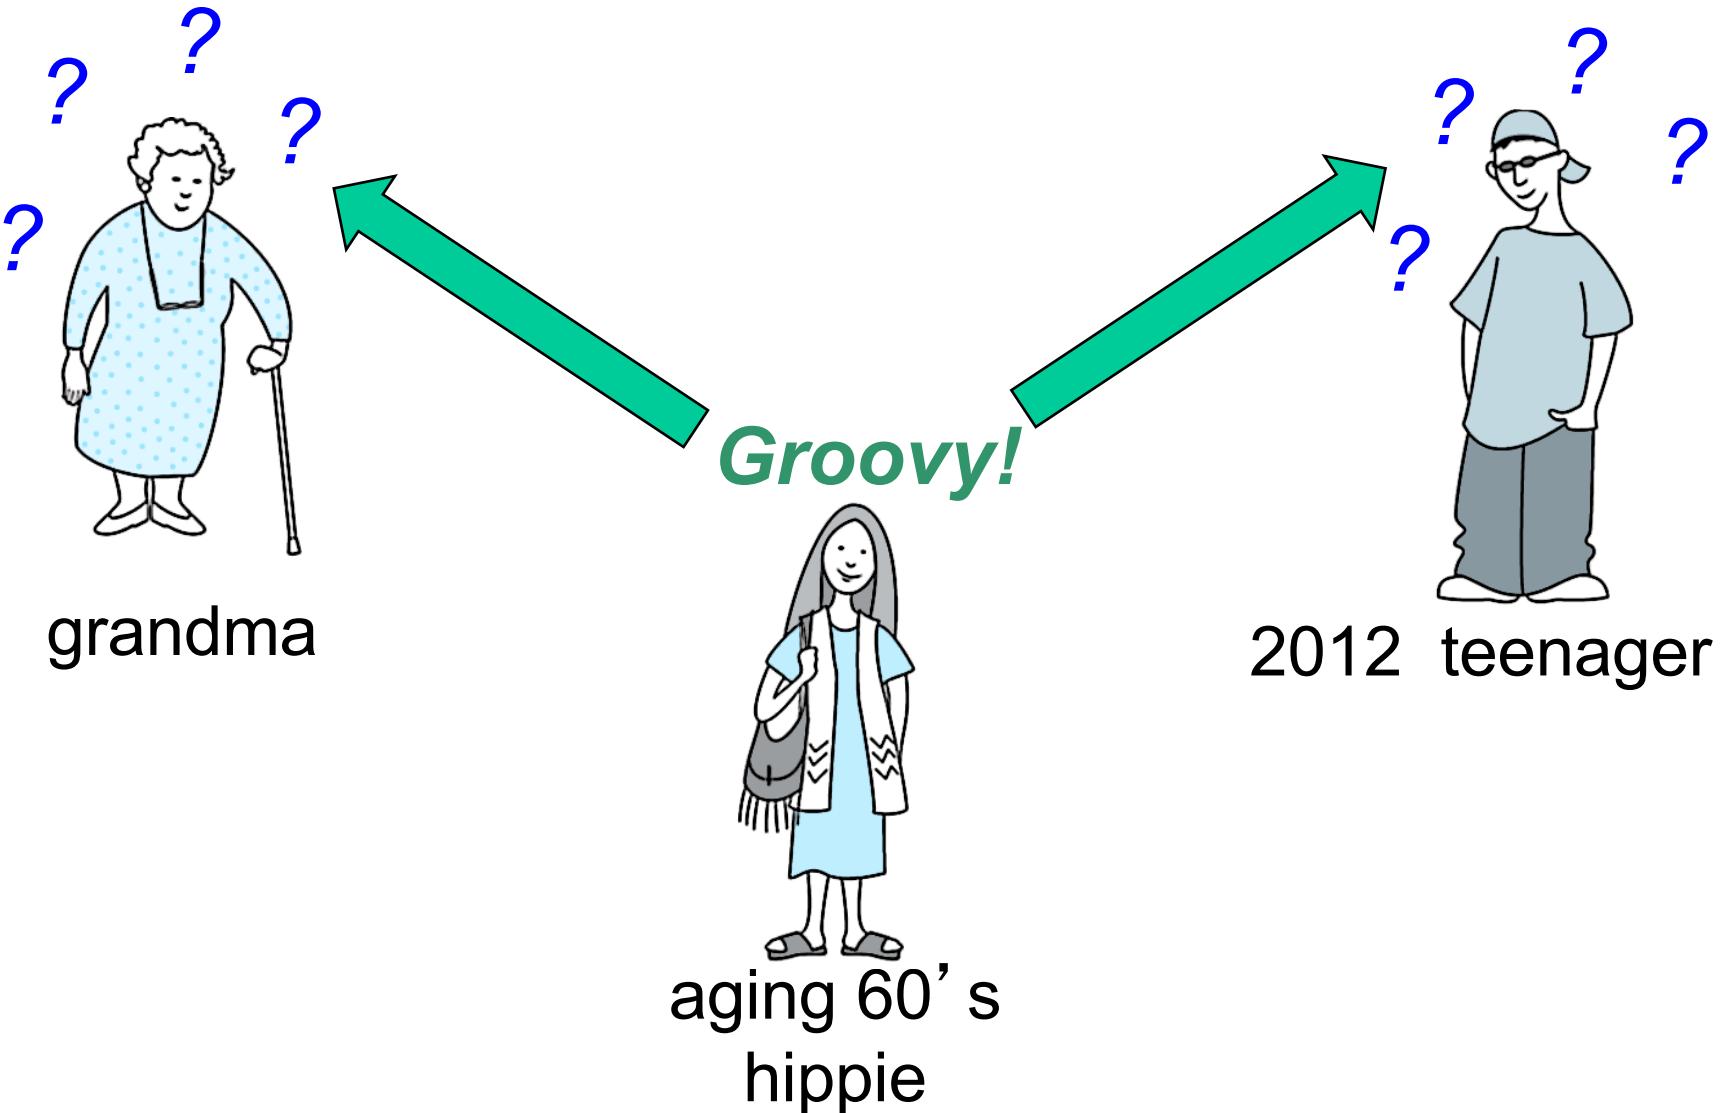

test.code
test.x

a
00000011
00000001

host 2 format

problem: different data format, storage conventions

A real-life presentation problem:

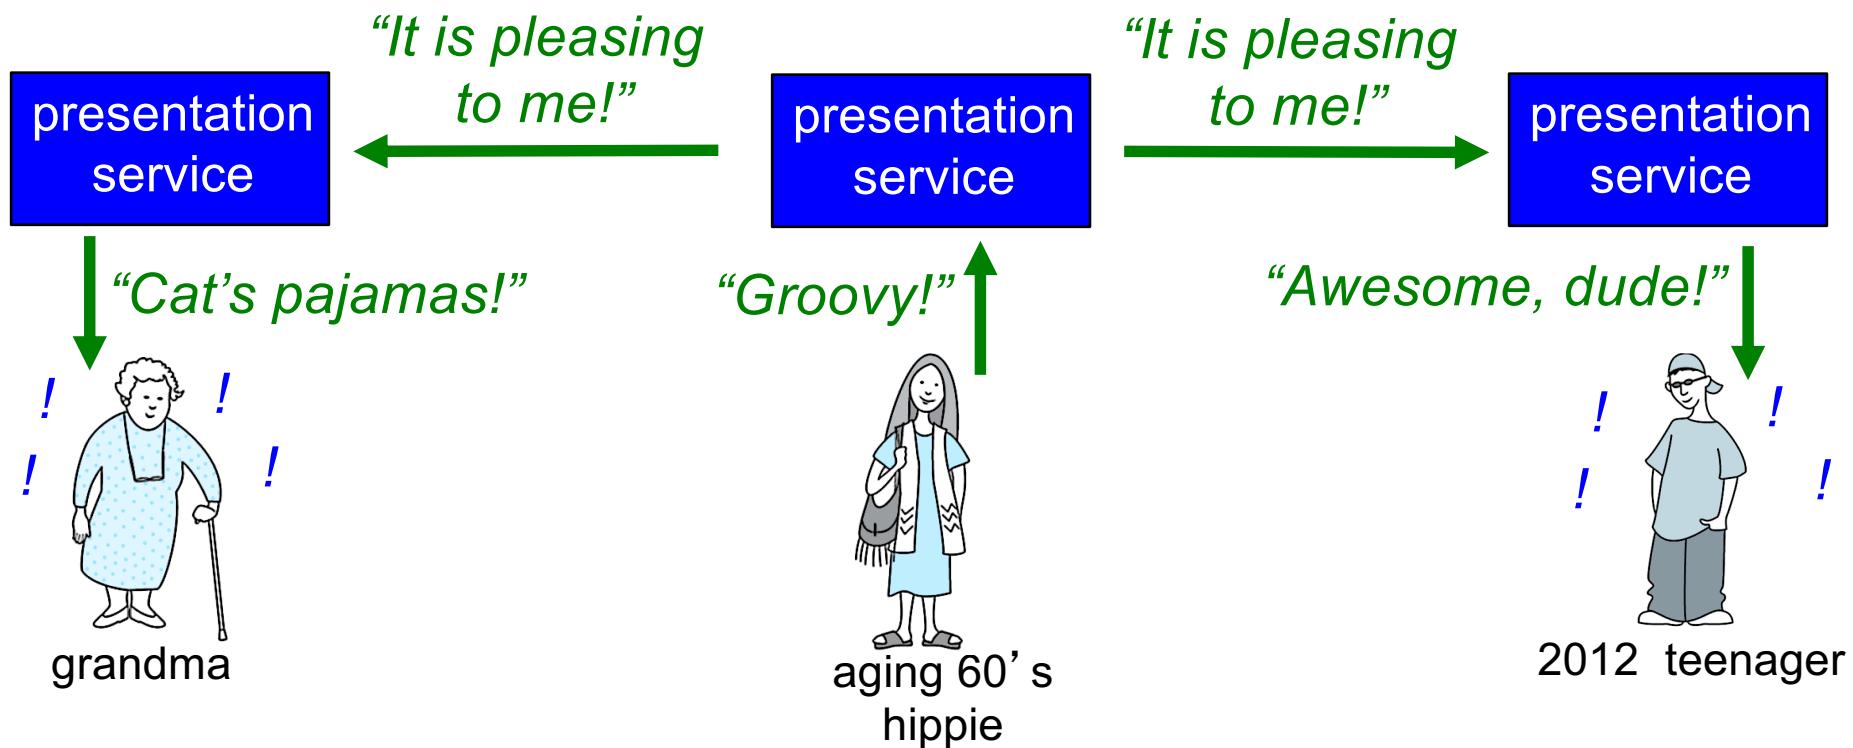

Presentation problem: potential solutions

- 1.** Sender learns receiver's format. Sender translates into receiver's format. Sender sends.
 - real-world analogy?
 - pros and cons?
- 2.** Sender sends. Receiver learns sender's format. Receiver translate into receiver-local format
 - real-world-analogy
 - pros and cons?
- 3.** Sender translates host-independent format. Sends. Receiver translates to receiver-local format.
 - real-world analogy?
 - pros and cons?

Solving the presentation problem

1. Translate local-host format to host-independent format
2. Transmit data in host-independent format
3. Translate host-independent format to remote-host format

ASN.1: Abstract Syntax Notation I

- ❖ ISO standard X.680
 - used extensively in Internet
 - like eating vegetables, knowing this “good for you”!
- ❖ defined data types, object constructors
 - like SMI
- ❖ BER: Basic Encoding Rules
 - specify how ASN.1-defined data objects to be transmitted
 - each transmitted object has Type, Length, Value (TLV) encoding

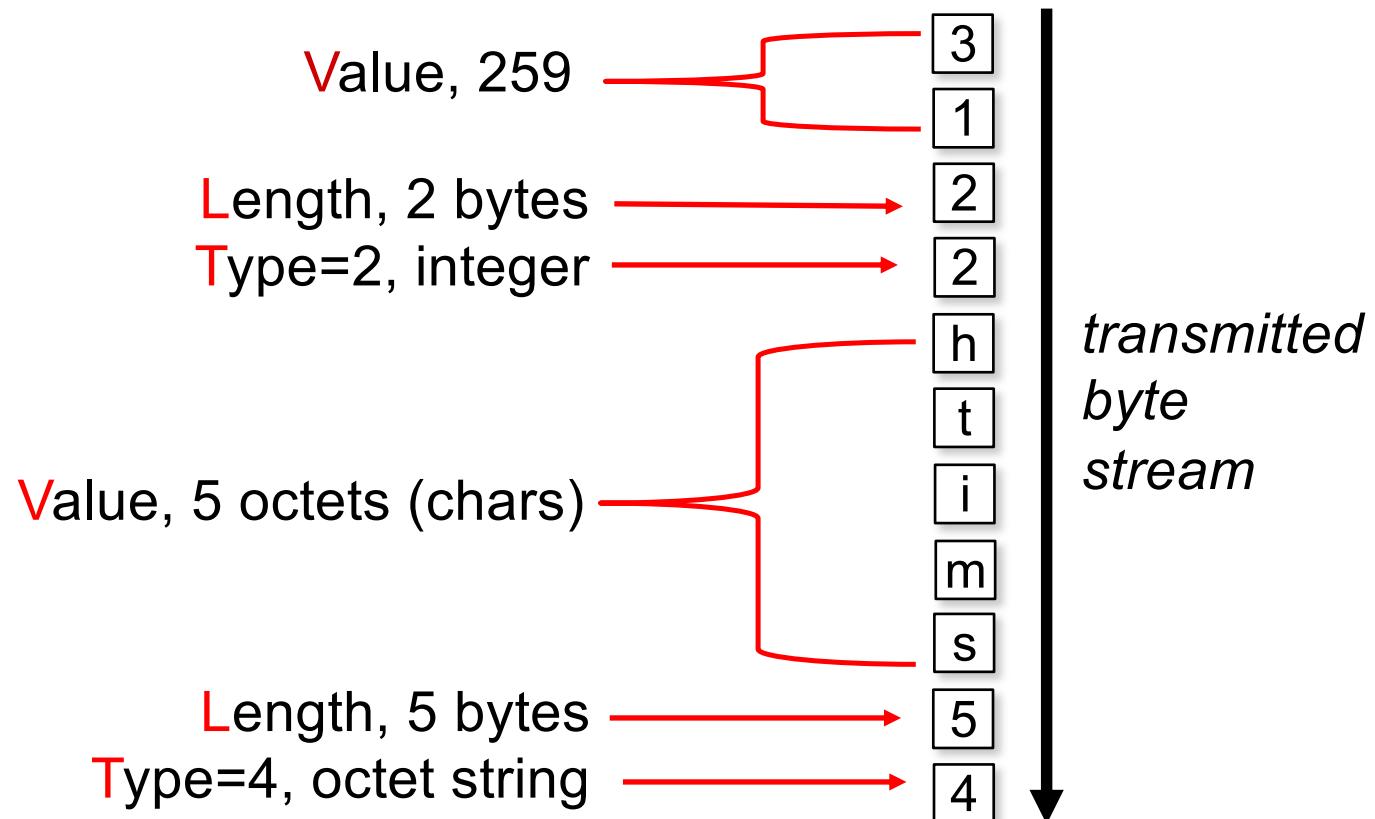

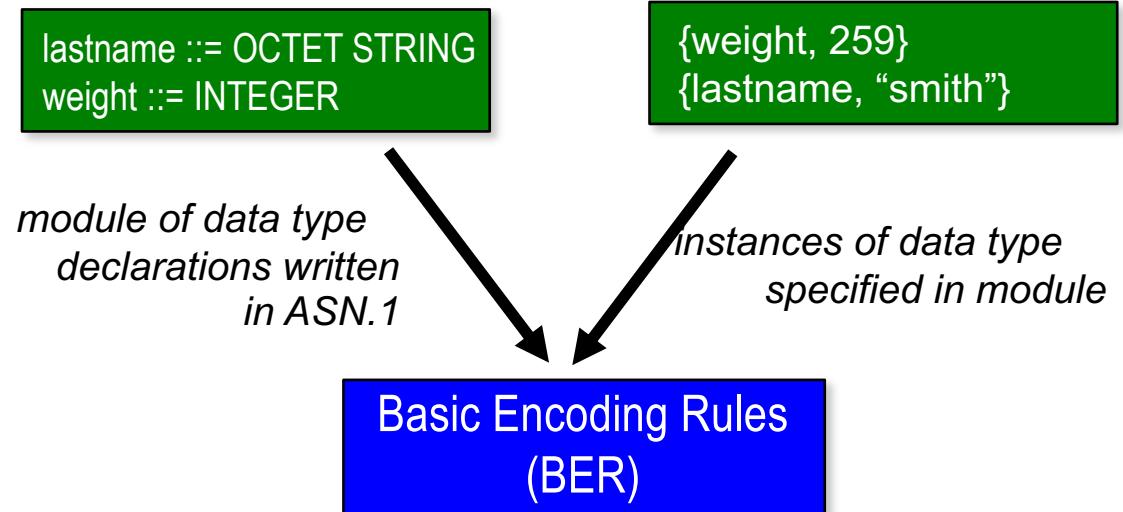

TLV Encoding

Idea: transmitted data is self-identifying

- T: data type, one of ASN.1-defined types
- L: length of data in bytes
- V: value of data, encoded according to ASN.1 standard

<u>Tag Value</u>	<u>Type</u>
1	Boolean
2	Integer
3	Bitstring
4	Octet string
5	Null
6	Object Identifier
9	Real

TLV encoding: example

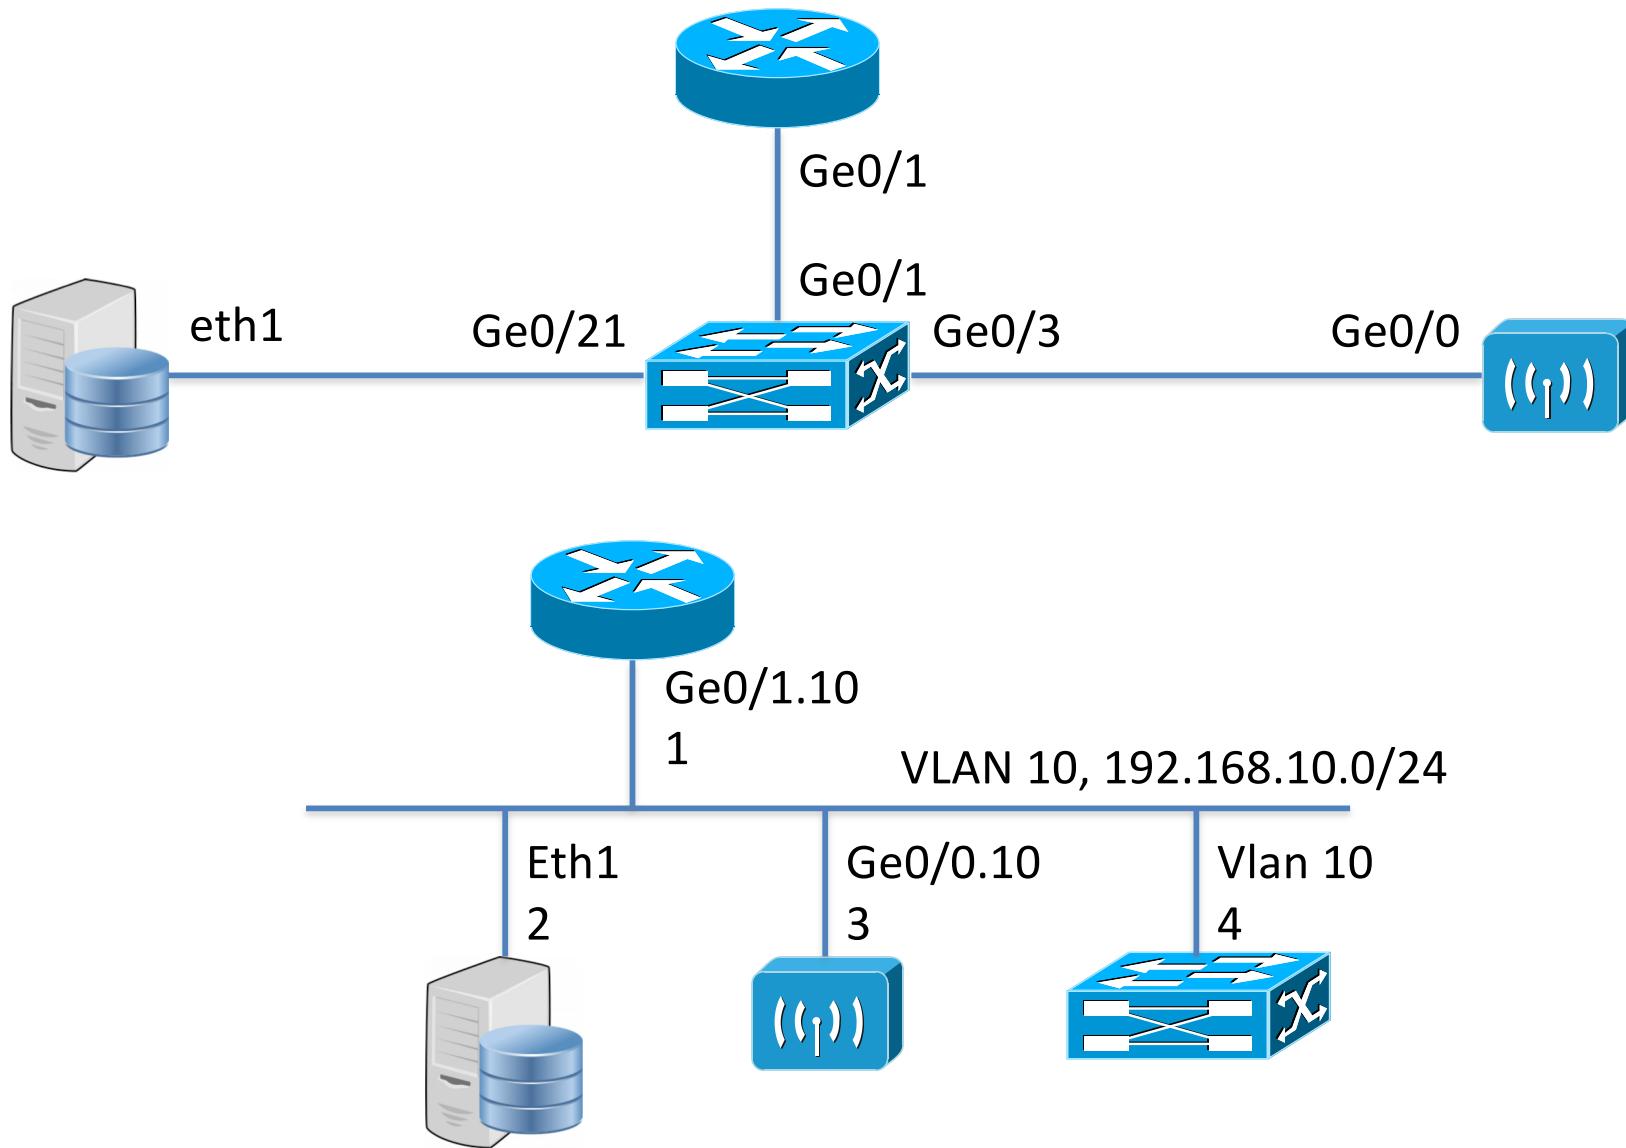

Network management: summary

- ❖ network management
 - extremely important: 80% of network “cost”
 - ASN.1 for data description
 - SNMP protocol as a tool for conveying information
- ❖ network management: more art than science
 - what to measure/monitor
 - how to respond to failures?
 - alarm correlation/filtering?

SNMP Hands-on

Layer1/2/3 Setup

SNMP: Monitoring Networks and Servers

- Packet loss? No answer to ping and telnet?
Routing table is not calculated?
 - Bandwidth saturates
 - CPU load is too high
 - Available memory is out
- Configure SNMPv3 service on network equipment, servers and end user devices
- And more information

Enabling SNMPv3 on Cisco Router and Switch

- Same setting to be applied to router and switch
 - User Name: iith
 - Group Name: iithauth
 - Password: iithsnmp
 - Authentication Protocol: MD5
- Configuration

```
switch1(config)#snmp-server engineID local 192168010004
switch1(config)#snmp-server group iithauth v3 auth
switch1(config)#snmp-server user iith iithauth v3 auth md5 iithsnmp
```

- Get information from Cat 2960

```
$ snmpwalk -v 3 -u iith -l authNoPriv -A iithsnmp 192.168.10.4
```

Enabling SNMPv3 on Linux Server

- Give same configuration to Linux server
- Edit /etc/snmp/snmpd.conf

```
# vi /etc/snmp/snmpd.conf
createUser iith MD5 iithsnmp
rwuser iith auth

# AGENT BEHAVIOR
# Comment for Local system
# Uncomment for all interfaces
agentAddress udp:161,udp6:[::1]:161
```

- Restart snmpd
service snmpd restart
- Get system information from your friends
